Destiné aux ingénieurs et étudiants en génie civil, mécanique, aéronautique ou encore maritime, cet ouvrage offre une introduction générale à l'étude des structures et à l'évaluation des charges pouvant être appliquées. Il décrit certaines méthodes d'analyse des structures isostatiques, puis traite spécifiquement de l'analyse externe et interne des poutres et des portiques, de l'analyse des structures réticulées ainsi que du calcul des déformations des structures élastiques à travers les méthodes énergétiques et géométriques. Chaque chapitre suit un même schéma didactique : une présentation des objectifs, une introduction générale, une démonstration du fondement de la méthode envisagée, le traitement numérique d'exemples précis, un résumé et, enfin, une série de problèmes permettant au lecteur d'appliquer chaque méthode d'analyse étudiée.

Fundamentals of Structural Analysis introduces, engineering and architectural students, to the basic techniques for analyzing the most common structural elements, including: beams, trusses, frames, cables, and arches. The content in this textbook covers the classical methods of analysis for determinate and indeterminate structures, and provides an introduction to the matrix formulation on which computer analysis is based. Although it is assumed that readers have completed basic courses in statics and strength of materials, the basic techniques from these courses are briefly reviewed the first time they are mentioned. To clarify discussion, this edition uses many carefully chosen examples to illustrate the various analytic techniques introduced, and whenever possible, examples confronting engineers in real-life professional practice, have been selected.

This book enables the student to master the methods of analysis of isostatic and hyperstatic structures. To show the performance of the methods of analysis of the hyperstatic structures, some beams, gantries and reticular structures are selected and subjected to a comparative study by the different methods of analysis of the hyperstatic structures. This procedure provides an insight into the methods of analysis of the structures.

Taranath provides case studies of buildings constructed in the past two decades to give insight into why and how structural systems were chosen. Particular emphasis is placed on wind and seismic forces.

Designed for courses in structural engineering in civil engineering and aeronautical engineering departments, this text presents both classical and modern models of analysis. It provides instruction on how to set up laboratory experiments to demonstrate abstract and difficult topics.

The Reinforced Masonry Engineering Handbook provides the coefficients, tables, charts, and design data required for the design of reinforced masonry structures. This edition improves and expands upon previous editions, complying with the current Uniform Building Code and paralleling the growth of reinforced masonry engineering. Discussions include: materials strength of masonry assemblies loads lateral forces reinforcing steel movement joints waterproofing masonry structures and products formulas for reinforced masonry design retaining walls and more This comprehensive, useful book serves as an exceptional resource for designers, contractors, builders, and civil engineers involved in reinforced masonry - eliminating repetitious and routine calculations as well as reducing the time for masonry design.

méthode de Clapeyron, la méthode des foyers, la méthode des forces, la méthode des rotations ou encore la méthode de distribution des moments. Chaque chapitre suit un même schéma didactique : une présentation des objectifs, une introduction générale, une démonstration du fondement de la méthode envisagée, le traitement numérique de quelques exemples, un résumé et, enfin, une série de problèmes permettant au lecteur d'appliquer chaque méthode d'analyse étudiée.

Developed as a resource for practicing engineers, while simultaneously serving as a text in a formal classroom setting, Wind and Earthquake Resistant Buildings provides a fundmental understanding of the behavior of steel, concrete, and composite building structures. The text format follows, in a logical manner, the typical process of designing a building, from the first step of determining design loads, to the final step of evaluating its behavior for unusual effects. Includes a worksheet that takes the drudgery out of estimating wind response. The book presents an in-depth review of wind effects and outlines seismic design, highlighting the dymamic behavior of buildings. It covers the design and detailing the requirements of steel, concrete, and composite buidlings assigned to seismic design categories A through E. The author explains critical code specific items and structural concepts by doing the nearly impossible feat of addressing the history, reason for existence, and intent of major design provisions of the building codes. While the scope of the book is intentionally broad, it provides enough in-depth coverage to make it useful for structural engineers in all stages of their careers.

Destiné aux ingénieurs et étudiants en génie civil, mécanique, aéronautique ou encore maritime, ce troisième volume se consacre à l'analyse des structures courbées. Analyse des structures 3 présente l'analyse des structures à câbles isostatiques, sollicitées par des charges ponctuelles, uniformément réparties et quelconques. Il décrit par la suite la réponse des structures en arcs isostatiques sous des forces concentrées et réparties, puis montre l'établissement des lignes d'influence des structures isostatiques par la méthode d'équilibre et en utilisant le principe de Muller-Breslau. Cet ouvrage traite également de l'analyse des structures en arcs hyperstatiques à un et plusieurs degrés d'hyperstaticité. Pour finir, il examine l'élaboration des lignes d'influence des structures hyperstatiques : les poutres, les portiques, les structures en arcs et les structures réticulées.

This book covers important performance characteristics of aeronautical structures. The subject matter is presented in layman's terms without complicated mathematical details. This has been a basic one quarter course for safety, contracting, maintenance, research management, professional engineers and other professionals dealing with related aeronautical and systems engineering fields in the US Air Force Institute of Technology (AFIT). The topics covered are aircraft design/ analysis, performance and their maintenance. The book addresses response characteristics of materials, and types of failures in aeronautical structures (e.g., fatigue, creep, fracture, buckling, and stress concentration) in both conventional metallic structures and composites. In most of the cases, as can be seen from publications resulting from AFIT masters level and PhD students' work (Chapter 11), this subject matter was one of the preparatory courses for their thesis or dissertation. The author has more than 40 years' experience in industry, research and academia including teaching this course for 5 years in AFIT.

"This text introduces engineering and architectural students to the basic techniques required for analyzing the majority of structures and the elements of which most structures are composed, including beams, frames, trusses, arches, and cables. Although the authors assume that readers have completed basic courses in statics and strength of materials, we briefly review the basic techniques from these courses the first time we mention them. To clarify the discussion, we use many carefully chosen examples to illustrate the various analytic techniques introduced, and whenever possible, we select examples confronting engineers in real-life professional practice"-- Provided by publisher.
