

Add the power of guided inquiry to your course without giving up lecture with **ORGANIC CHEMISTRY: A GUIDED INQUIRY FOR RECITATION, Volume II**. Slim and affordable, the book covers key Organic 2 topics using POGIL (Process Oriented Guided Inquiry Learning), a proven teaching method that increases learning in organic chemistry. Containing everything you need to energize your teaching assistants and students during supplemental sessions, the workbook builds critical thinking skills and includes once-a-week, student-friendly activities that are designed for supplemental sessions, but can also be used in lab, for homework, or as the basis for a hybrid POGIL-lecture approach. Important Notice: Media content referenced within the product description or the product text may not be available in the ebook version.

The volume begins with an overview of POGIL and a discussion of the science education reform context in which it was developed. Next, cognitive models that serve as the basis for POGIL are presented, including Johnstone's Information Processing Model and a novel extension of it. Adoption, facilitation and implementation of POGIL are addressed next. Faculty who have made the transformation from a traditional approach to a POGIL student-centered approach discuss their motivations and implementation processes. Issues related to implementing POGIL in large classes are discussed and possible solutions are provided. Behaviors of a quality facilitator are presented and steps to create a facilitation plan are outlined. Succeeding chapters describe how POGIL has been successfully implemented in diverse academic settings, including high school and college classrooms, with both science and non-science majors. The challenges for implementation of POGIL are presented, classroom practice is described, and topic selection is addressed. Successful POGIL instruction can incorporate a variety of instructional techniques. Tablet PC's have been used in a POGIL classroom to allow extensive communication between students and instructor. In a POGIL laboratory section, students work in groups to carry out experiments rather than merely verifying previously taught principles. Instructors need to know if students are benefiting from POGIL practices. In the final chapters, assessment of student performance is discussed. The concept of a feedback loop, which can consist of self-analysis, student and peer assessments, and input from other instructors, and its importance in assessment is detailed. Data is provided on POGIL instruction in organic and general chemistry courses at several institutions. POGIL is shown to reduce attrition, improve student learning, and enhance process skills.

Research has identified cooperative learning as one of the ten High Impact Practices that improve student learning. If you've been interested in cooperative learning, but wondered how it would work in your discipline, this book provides the necessary theory, and a wide range of concrete examples. Experienced users of cooperative learning demonstrate how they use it in settings as varied as a developmental mathematics course at a community college, and graduate courses in history and the sciences, and how it works in small and large classes, as well as in hybrid and online environments.

The authors describe the application of cooperative learning in biology, economics, educational psychology, financial accounting, general chemistry, and literature at remedial, introductory, and graduate levels. The chapters showcase cooperative learning in action, at the same time introducing the reader to major principles such as individual accountability, positive interdependence, heterogeneous teams, group processing, and social or leadership skills. The authors build upon, and cross-reference, each others' chapters, describing particular methods and activities in detail. They explain how and why they may differ about specific practices while exemplifying reflective approaches to teaching that never fail to address important assessment issues.

Process Oriented Guided Inquiry Learning (POGIL) is a method of instruction where each student takes an active role in the classroom. The activities contained in this collection are specially designed guided inquiry activities intended for the student to complete during class while working with a small group of peers. Each activity introduces essential organic chemistry content in a model that contains examples, experimental data, reactions, or other important information. Each model is followed by a series of questions designed to lead the student through the thought processes that will result in the development of critical organic chemistry concepts. At the end of each activity are additional questions, which will generally be completed outside of class time and are more similar to questions that might appear on tests. Before each class, students should ensure that they are familiar with the prior knowledge that is listed at the beginning of every activity. These POGIL Organic Chemistry activities were written to cover most of the important concepts for a two semester organic chemistry sequence. The activities are grouped into organic 1 and organic 2, although that might vary from class to class depending on the textbook used. Some concepts do not have an activity, particularly if the concept is of narrow focus. The following are some ideas for introducing additional concepts that do not have an activity.

- Assign the topic as homework/reading outside of class.
- Mini-lecture on the concept.
- Prepare a "mini-activity" on the concept to be done in groups during class. Usually a miniactivity consists of one model and questions on a single slide.

Process Oriented Guided Inquiry Learning (POGIL) Amer Chemical Society  
Presents an overview of high school-level chemistry, covering building blocks of matter, physical behavior of matter, chemical bonding, chemical reactions, stoichiometry, solutions, acids and bases, equilibrium, organic chemistry, and radioactivity. Each chapter begins with clearly stated objectives and includes reviews of content, examples, key chain sidebars, and practice questions with solutions.
