The primary purpose in this book is to present an integrated and innovative methodological approach for the construction and selection of equity portfolios. The approach takes into account the inherent multidimensional nature of the problem, while allowing the decision makers to incorporate specified preferences in the decision processes. A fundamental principle of modern portfolio theory is that comparisons between portfolios are generally made using two criteria; the expected return and portfolio variance. According to most of the portfolio models derived from the stochastic dominance approach, the group of portfolios open to comparisons is divided into two parts: the efficient portfolios, and the dominated. This work integrates the two approaches providing a unified model for decision making in portfolio management with multiple criteria.?

Portfolio Management: Theory, Behavioral Aspects and Application covers behavioral aspects

of investing, investment strategies including buy and sell disciplines, technical analysis, personal finance considerations, plus the more standard textbook topics of systematic portfolio management, portfolio construction and analysis, security valuation and risk analysis, asset class management, portfolio applications, derivative valuation and portfolio evaluation. The behavioral topics range from psychological factors to "deadly sins" of financial decision making. As part of the behavioral aspects a brief overview of technical analysis is presented. Our goal in this book is to blend the theory of portfolio selection and asset pricing with the behavioral side of investing and introducing "pragmatic applications." This is not a book that only prescribes what portfolio managers or investors should or should not undertake. Instead it recognizes that the savings and investment process is dependent on individual choice and the decisions regarding the appropriate portfolio should be based on risk tolerance. The first two chapters set the stage for portfolio management by presenting systematic portfolio management and behavioral aspects. These chapters help lay out the environment in which investors and portfolio managers operate. The next three chapters present modern portfolio theory, capital market theory including the capital asset pricing model, and arbitrage pricing theory. We then move into valuation of two primary asset classes, debt instruments and equity. This valuation section presents basic valuation and risk characteristics of two main asset classes, namely bonds and stocks, that are large, global, part of "everyone's portfolio," and they are the basis for many derivative instruments. Next, we turn our attention to strategies and managing portfolios for several chapters. Disciplined stock selection and tactics are presented in Chapter 9, while the most important decisions relating to portfolio management, namely asset allocation, is discussed in Chapter 10. Styles and strategies, and global investing are

then presented in the next two chapters respectively. Chapter 13 presents strategies for managing bond portfolios. Our attention then turns to derivative securities in Chapters 14 and 15. The book concludes with a critical element of portfolio management, namely evaluation of performance. Appendix A presents Internet sources and Appendix presents an overview of personal finance. If you are interested in adopting this book for your portfolio management or investments course (it has been used in both) and would like a complimentary copy please contact: Dr. Walter J. Reinhart Loyola University Graduate Center 2034 Greenspring Drive Timonium, MD 21093 TEL: 410.617.1555 When you adopt the book, suggested answers to the end of chapter questions and problems will be provided, along with power point slides. This book analyses investment management policies for institutional investors. It is composed of four parts. The first one analyses the various types of institutional investors, institutions which, with different objectives, professionally manage portfolios of financial and real assets on behalf of a wide variety of individuals. This part goes on with an in-depth analysis of the economic, technical and regulatory characteristics of the different types of investment funds and of other types of asset management products, which have a high rate of substitutability with investment funds and represent their natural competitors. The second part of the book identifies and investigates the stages of the investment portfolio management. Given the importance of strategic asset allocation in explaining the ex post performance of any type of investment portfolio, this part provides an in-depth analysis of asset allocation methods, illustrating the different theoretical and operational solutions available to institutional investors. The third part describes performance assessment, its breakdown and risk control, with an in-depth examination of performance evaluation techniques, returns-based style analysis

approaches, and performance attribution models. Finally, the fourth part deals with the subject of diversification into alternative asset classes, identifying the common characteristics and their possible role within the framework of investment management policies. This part analyses hedge funds, private equity, real estate, commodities, and currency overlay techniques.

Investors are trying to generate excess returns through active investment strategies. Since the outbreak of the financial crisis, investors face a situation where increased risks are accompanied by falling key interest rates. An optimal portfolio in terms of risk and return becomes a perpetual motion machine. Markus Vollmer answers the question how the seemingly impossible could still be achieved by an empirical analysis of historical data of 1'800 stocks listed at equity markets in 24 countries covering all 19 super sectors. The author offers valid and reliable findings by using the previously mentioned data proxy. He reveals purposefully the need for further research and simultaneously he derives specific and applicable guidelines for the design of investment strategies which are extremely exciting for both the institutional expert and the private investor.
