Delves into how the central nervous system governs behaviour Introduction to Biopsychology, 9/e, introduces the study of the biology of behaviour; that is, the neural mechanisms of psychological processes in the central nervous system. This program combines biopsychological science and student-oriented discussion, interweaving the basics of this specialized field with clinical case studies and exploring the personal and social implications that arise. The author encourages interactive learning and creative thinking. His clear and engaging presentation makes the material personally and socially relevant to readers.

This is a comprehensive undergraduate textbook which provides, in a single volume, chapters on both normal cognitive function and related clinical disorder.

Foundations of Biopsychology is an ideal companion for any biopsychology student and is particularly suitable for use on a semester-based course. This book is an introduction to how the brain produces behaviour. It does not assume any background knowledge in biology or psychology. Although academically rigorous, the text adopts an accessible, modular format and is supported throughout by diagrams and images.

takes first year psychology students through the entire process of doing research in psychology, from exploring designs and methods, to conducting step-by-step, by-hand data analysis, and writing up their findings, all in a friendly and accessible way. The text begins by presenting a thorough overview of research, explaining its central role in psychology as a science and exploring how to read and present research findings before introducing students to both qualitative and quantitative approaches to research. The author then explores experimental and correlational designs in detail, introducing the general principles before addressing the logic of the specific data analyses used in these forms of design. Dedicated chapters show students how to calculate independent and repeated t tests, and independent measures ANOVA in the experimental design section, and correlation and regression analyses in the correlation section. After guiding students through these essentials, the author moves on to a detailed explanation of when to use non-parametric tests, and again takes students through these data analyses in a carefully-paced series of hand calculations. The text concludes with a clear guide to when to use which test, and takes a look forward to the sorts of statistical analyses students will encounter in both published research and the next phase of their studies.

behavior,'which is a modular subject in many university courses. The authors attempts to prepare students to understand physiological concepts in other specialized fields that they will encounter in their higher studies—it is suitable for undergraduate college students as well. The book is organised into four chapters. The first chapter covers the areas Brain and Behaviour, which includes techniques in neurophysiology, the neuron and its functions, Central Nervous System (CNS), Autonomous Nervous System (ANS), Sympathetic Nervous System (SNS), Para Sympathetic Nervous System (PSNS), neurotransmitters and drug action. The second chapter deals with biological basis of sensory processes, which includes visual, auditory, gustatory, olfactory and cutaneous systems. The third chapter contains physiological basis of sleep, eating, drinking and sexual behaviour while the last chapter covers the areas of emotion, learning and memory.

Accompanying compact disc titled "Student CD-ROM to accompany Neuroscience : exploring the brain" includes animations, videos, exercises, glossary, and answers to review questions in Adobe Acrobat PDF and other file formats.

If you've ever been tricked by an optical illusion, you'll have some idea about just how clever the relationship between your eyes and your brain is. This book leads one through the intricacies of the subject and demystifying how we see.

"This book is designed to help students organize their thinking about psychology at a conceptual level. The focus on behaviour and empiricism has produced a text that is better organized, has fewer chapters, and is somewhat shorter than many of the leading books. The beginning of each section includes learning objectives; throughout the body of each section are key terms in bold followed by their definitions in italics; key takeaways, and exercises and critical thinking activities end each section"--BCcampus website.

Cognitive Psychology: Theory, Process, and Methodology introduces readers to the main topics of study in this exciting field through an engaging presentation of how cognitive processes have been and continue to be studied by researchers. Using a reader-friendly writing style and focusing on methodology, authors Dawn M. McBride and J. Cooper Cutting cover such core content as perception, attention, memory, language, reasoning and problem solving, and cognitive neuroscience. Updates to the Second Edition include a reorganization of long-term memory topics to improve readability, revised pedagogical tools throughout, a refreshed visual program, and additional real-life examples to enhance understanding.

How do animals perceive the world, learn, remember, search for food or mates, communicate, and find their way around? Do any nonhuman animals count, imitate one another, use a language, or have a culture? What are the uses of cognition in nature and how might it have evolved? What is the current status of Darwin's claim that other species share the same "mental powers" as humans, but to different degrees? In this completely revised second edition of *Cognition*,

Evolution, and Behavior, Sara Shettleworth addresses these questions, among others, by integrating findings from psychology, behavioral ecology, and ethology in a unique and wide-ranging synthesis of theory and research on animal cognition, in the broadest sense--from species-specific adaptations of vision in fish and associative learning in rats to discussions of theory of mind in chimpanzees, dogs, and ravens. She reviews the latest research on topics such as episodic memory, metacognition, and cooperation and other-regarding behavior in animals, as well as recent theories about what makes human cognition unique. In every part of this new edition, Shettleworth incorporates findings and theoretical approaches that have emerged since the first edition was published in 1998. The chapters are now organized into three sections: Fundamental Mechanisms (perception, learning, categorization, memory), Physical Cognition (space, time, number, physical causation), and Social Cognition (social knowledge, social learning, communication). Shettleworth has also added new chapters on evolution and the brain and on numerical cognition, and a new chapter on physical causation that integrates theories of instrumental behavior with discussions of foraging, planning, and tool using.
