This volume explores emerging research and pedagogy in analytics, collaboration, and decision support with an emphasis on business intelligence and social media. In general, the chapters help understand where technology involvement in human decisions is headed. Reading the chapters can help understand the opportunities and threats associated with the use of information technology in decision making. Computing and information technologies are reshaping our global society, but they can potentially reshape it in negative as well as positive ways. Analytics, collaboration

and computerized decision support are powerful decision aiding and decision making tools that have enormous potential to impact crisis decision making, regulation of financial systems, healthcare decision making and many more important decision domains. Many information technologies can potentially support, assist and even decide for human decision makers. Despite the potential, some researchers think that we know the answers to how these technologies will change society. The "Wisdom of Crowds" or "Big Data" become the topic of the day and are soon replaced with new marketing terms. In many ways, mobile technology is just another form factor to adapt decision support capabilities too and experiment with new capabilities. The cloud is a nebulous metaphor that adds to the mystery of information technology. Wireless technology enables the ubiquitous presence of analytics and decision support. With new networking capabilities, collaboration is possible anywhere and everywhere using voice, video and text. Documents can be widely shared and massive numbers of documents can be carried on a small tablet computer. Recent developments in technologies impact the processes organizations use to make decisions. In addition, academics are looking for ways to enhance their pedagogy to train students to be more adept in understanding how emerging technology will be used effectively for decision making in organizations. The chapters are based on papers originally reviewed at the Special Interest Group on Decision Support Systems (SIGDSS) Workshop at the 2013 International Conference on Information Systems (ICIS 2013). Ultimately this volume endeavors to find a balance between systematizing what we know, so we can teach our findings from prior research better, and stimulating excitement to move the field in new directions.

"Outlines the technology strategy boards vision, objectives

and strategy and gives an overview of their work, products and contacts. Also identifies its key technology areas and outlines their future strategies."--DTI website (Reports and Publications).

Business intelligence refers to the technologies and strategies that are used by enterprises for the data analysis of business information. It provides historical, predictive and current views of business operations. Some of the common functions of business intelligence are online analytical processing, reporting, data mining, complex event processing and business performance management. It is also used for text mining, predictive analytics and prescriptive analysis. Technologies used in business intelligence have the capacity for handling large amounts of structured and unstructured data. This data is used for the identification, development and creation of new strategic business opportunities. This book elucidates the concepts and innovative models around prospective developments with respect to business intelligence. It picks up individual branches and explains their need and contribution in the context of a growing economy. This textbook is appropriate for those seeking detailed information in this area.

This book includes recent research works on how business around the world affected by the time of COVID-19 pandemic. The impact of recent technological developments has had a tremendous impact on how we manage disasters. These developments have changed how countries and governments collect information. The COVID-19 pandemic has forced online service companies to maintain and build relationships with consumers when their world turns. Businesses are now

facing tension between generating sales during a period
of severe economic hardship and respect for threats to
life and livelihoods that have changed consumer
preferences.

In the era of knowledge economy, getting the right
information to decision makers at the right time is critical
to their business success. One such attempt includes the
growing use of business analytics. Generally speaking,
business analytics refers to a broad use of various
quantitative techniques such as statistics, data mining,
optimization tools, and simulation supported by the query
and reporting mechanism to assist decision makers in
making more informed decisions within a closed-loop
framework seeking continuous process improvement
through monitoring and learning. Business analytics also
helps the decision maker predict the future business
activities based on the analysis of historical patterns of
past business activities. For example, your nearby
grocery chain, such as Kroger, might frequently issue
discount coupons tailored for each customer based on
his past shopping patterns. This practice encourages the
customer to consider buying the discounted but favorite
items repeatedly, while building customer loyalty. This
practice is possible, since a smart use of business
analytics allows the grocery store to figure out which
items are likely to be purchased by which customer in his
next grocery shopping trip. Likewise, application
potentials of business analytics are enormous given the
abundant data available from the digital and mobile data
sources. Although business analytics has been rapidly
gaining popularity among practitioners and academicians

alike in the recent past, its conceptual foundation has existed for centuries. One of the first forms of business analytics may be statistics whose uses can be traced back at least to the biblical times in ancient Egypt, Babylon, and Rome. The word analytics has come into the foreground in last decade or so. The proliferation of the internet and information technology has made analytics very relevant in the current age. Analytics is a field which combines data, information technology, statistical analysis, quantitative methods and computer-based models into one. This all are combined to provide decision makers all the possible scenarios to make a well thought and researched decision. The computer-based model ensures that decision makers are able to see performance of decision under various scenarios. Business analytics has a wide range of application from customer relationship management, financial management, and marketing, supply-chain management, human-resource management, pricing and even in sports through team game strategies. 20??????? ?????500??? ????40?????????? ??????????????? ???????????????????????
