More Exceptional C++ continues where Herb Sutter's best-selling Exceptional C++ left off, delivering 40 puzzles that illuminate the most challenging -- and most powerful -- aspects of C++. More Exceptional C++ offers many new puzzles focused on generic programming and the C++ Standard Template Library, including important techniques such as traits and predicates, as well as key considerations in using standard containers and algorithms -- many of them never covered elsewhere. More Exceptional C++ contains a detailed new section (and two appendices) on optimization in single- and multithreaded environments. It also provides important new insights on crucial topics first introduced in Exceptional C++, including exception safety, generic programming, and memory management. For all C++ programmers.

Example of Exercise: We want to design a program that allows us to control the boxes of a supermarket so that it is more efficient to collect products to customers. The supermarket has 10 boxes to which customers can go. The owner of the supermarket has asked us to give him a program to indicate to the client that he is going to the boxes, in which of the boxes it will take less time, that is to say, in which of the boxes there are less products between the clients They wait in that box. To do this, we will design a Savings Box class, which will allow you to handle this information and solve the problem raised. Specifically, the operations that this class must offer are: Construction of the object Boxes Supermarket that will build the

necessary data to operate the control of boxes, but without any client in any box. Build the empty structure.
`int Products (int box):` given a box (identified with a number from 1 to 10) returns the total number of products that customers are waiting to be served in the box.
`int EmptyBox ():` it will look for any box that does not have a client and in the affirmative it will return the identifier of the box that does not have clients. If no box is empty the method will return -1.
`int ClientServit (int box):` it will remove the client that is being served in the box that enters as a parameter, and therefore you will have to update how to match the corresponding data.
`void AddClient (int id, int np):` You will have to check everything that you touch and decide on which box you must tailor the customer with an id and purchase np products. If any box is free, you will have to put it in the free box, and if there is no free box, you must put it in that box that has fewer pending products to be charged.
NOTE: The Customer class may already be implemented, with the following specification:
`Class Client{ int Ident; int Nprods; Client (int id, int np) Prec: Post: int identifier () Prec: Post: int NProducts () Prec: Post: }`

Jones and Harrow present programming concepts in the context of solving problems. Each chapter introduces a problem first, and then covers the C language elements needed to solve it. Students can see how a program is built from its simplest beginning to its final polished form. This book introduces beginning programming concepts using the C language. Each chapter introduces a problem to solve, and then covers the C language constructs necessary to solve the problem. Rather than presenting a series of polished, one-step solutions to programming problems, this text seeks to lead you through the process of analyzing problems and writing programs to solve them. This text is intended to be used in a one or two semester course covering introductory programming using C. No previous knowledge of mathematics or computer science is assumed, other than a familiarity with the mathematical notation used in a high-school algebra course.
