The U.S. Army is in the process of destroying the nation's stockpile of aging chemical weapons stored at eight locations in the continental United States and on Johnston Atoll in the Pacific. Originally, incineration was chosen for the destruction of these stores, but this method has met with public opposition, and Congress directed the Army to develop alternative technologies for destroying the stockpiles in Pueblo, CO and Richmond, KY. To assist the Army in this process, the NRC was asked to evaluate the engineering design study of the three Blue Grass candidates. This book presents an analysis of various issues pertaining to the proposed engineering design package for the Blue Grass facility.

Anatomy & Physiology (includes A&P Online course) E-Book

Experimental science is a complicated creature. At the head there is a Gordian knot of ideas and hypotheses; behind is the accumulated mass of decades of research. Only the laboratory methods, the legs which propel science forward, remain firmly in touch with the ground. Growth, however is uneven; dinosaurs develop by solid means to give a vast body of results, but few ideas. Others sprint briefly to success with brilliant, though ill-supported, ideas. The problems which this book addresses is to maintain an organic unity between new ideas and the current profusion of innovative experimental tools. Only then can we have the framework on which our research thoughts may flourish. The contributors are outstanding scientists in their respective fields and they record here in a clear manner the methodology with which they perform their experiments. They also illustrate some of their most exciting findings. In all chapters the emphasis is on the critical analysis of the methodology which is often avoided in refereed Journals. These techniques are explained in this book in adequate detail. Each chapter is extensively referenced and contains the most recent material available from author's laboratory at the time of going to press.

The volumes that have appeared in the three years since BIOMEMBRANES was launched illustrate the kinds of information the editor and the publishers envisaged would constitute the series. Some, such as this one, would consist of scholarly reviews of specialized topics; some, such as Volumes 2 and 3, would be the published chronicles of conferences; and others, such as Volumes 4 and 6, would be specialized monographs. In this way, we have hoped to provide not only reasoned critical opinions but also ideas "hot off the press." Whether or not the views articulated ultimately stand the test of time is not as important as that their dissemination to the scientific community provides that unique stimulation that only flows from the interchange of ideas. This volume includes chapters on a number of different topics. Rosenthal and Rosenstreich have reviewed the accumulated evidence associating a visible structure of T lymphocytes, the Uropod, with immunologic "activation." This is the first of many articles that will appear which associates the immune response with membrane function. A current example of Wallach's ability to approach a problem in a unique and original manner is contained in his review of the effects of ionizing radiation on membranes. Dale Oxender has been active in the study of transport for many years. His review is a careful documentary of the properties of specific binding
