Aug 18 2020 Printed in COLOR Electronic Warfare (EW) is considered a relatively inexpensive way to curb an opponent's ability to communicate and exercise control within a battlespace. By now, everyone is aware that the incident where a Su-24 bomber allegedly flew over the American destroyer 'Donald Cook' described in practically all Russian media, during which the Russian aircraft supposedly employed its newest 'Khibiny' system to disable the ship's electronics is RUMINT (RUMINT - RUmor INTelligence [military]). RUMINT can be described as single-source disinformation that obfuscates or "puffs up" an adversary's capabilities. The text in RED thruout the book is RUMINT. Russia's electronic warfare equipment specifications are a closely held SECRET so a lot is missing, but I was able to find quite a bit thru open sources. I will update as I find more. The systems included in this book typically have their own specialization. For example, the Divnomorye complex suppresses locators and other avionics of aircraft, helicopters and drones. The station also creates powerful interference for "flying radars" - E-3 AWACS, E-2 Hawkeye and E-8 JSTAR. It can hide objects within a radius of several hundred kilometers from radar detection. The Murmansk-BN complex suppresses communication and control channels within a radius of up to eight thousand kilometers. This technique is able to strip communications of warships, aircraft, drones and headquarters of the troops of a potential enemy. Electronic warfare systems "Moskva-1", "Krasukha-20" and "Krasukha-4" are often called "aircraft systems." They are designed to deal with aviation radars, as well as communications and information transfer technology. "Moskva-1" detects the enemy, determines the type and characteristics of its electronic warfare. Data is transferred to other systems. Krasukha-20 is responsible for the fight against early warning radar aircraft and "Kraukha-4" interferes with other types of aircraft. Thanks to experiences in conflicts in Georgia, Ukraine and Syria, Russia's EW systems and tactics are evolving. The systems are more mobile, intelligent, and automated with a transition from narrowly specialized equipment to multifunction complexes, for the disruption of many types of electronic systems-radars, radio communications, navigation and others. The tactics are changing as well. For instance, Russian forces in Ukraine have been using small unmanned aircraft with electro-optical cameras and electronic direction finders to specifically locate and then jam counter-battery radars ahead of mortar and other artillery strikes. According to Ukrainian General Kremenetskyi, Russian armed forces have developed their EW doctrines and they have been adept at learning lessons from recent conflicts and adapted their systems accordingly. "The speed with which the Russians have adapted their EW

tactics has been very quick." Of course, Russian EW operators (occasionally) also simultaneously jam their own forces' equipment. If you have any of the missing information, or if you see information that needs to be corrected, please send message thru our website USGOVPUB.com. 4th Watch Publishing is a SDVOSB.

Look to this informative new reference for an in-depth, comprehensive treatment of the principles of electronic warfare (EW). Written by leading experts in the field, this authoritative book takes a systematic approach to exploring EW theory, mathematical models, and quantitative analysis. You get a detailed examination of the basic targets of EW operations, a thorough presentation of critical radar jamming methods, and definitions of the effectiveness criteria for EW systems and techniques.

Antennas are part of every radar, every communications system, and every electronic warfare system. Therefore antennas are an important technical subject. The number of antenna books that have been published in the last 5 years alone attest to this fact. But why another book about antennas? What does this book offer that is different from all the others? The answer is: accessibility. Most of the technical literature on antennas is written for those with extensive backgrounds in electromagnetic theory and familiarity with the mathematical language of vector analysis, differential equations, and special functions. This puts much of the antenna literature out of reach for the nonspecialist who needs to understand the subject but cannot afford the time required to become familiar with all the background material. With the rapid expansion of technical knowledge, the number of engineering students who find themselves attracted to "classical" subjects, such as electromagnetic theory, is on the decline, making it increasingly difficult to train engineers in areas involving antennas. Some authors in other technical fields have recognized this problem. For example, books on solid-state electronic devices that do not require an extensive background in quantum mechanics are available, useful, and informative. This book fulfills a similar need in the area of antennas.

This comprehensive book gives an overview of how cognitive systems and artificial intelligence (AI) can be used in electronic warfare (EW). Readers will learn how EW systems respond more quickly and effectively to battlefield conditions where sophisticated radars and spectrum congestion put a high priority on EW systems that can characterize and classify novel waveforms, discern intent, and devise and test countermeasures. Specific techniques are covered for optimizing a cognitive EW system as well as evaluating its ability to learn new information in real time. The book presents AI for electronic support (ES), including characterization, classification, patterns of life, and intent

recognition. Optimization techniques, including temporal tradeoffs and distributed optimization challenges are also discussed. The issues concerning real-time in-mission machine learning and suggests some approaches to address this important challenge are presented and described. The book covers electronic battle management, data management, and knowledge sharing. Evaluation approaches, including how to show that a machine learning system can learn how to handle novel environments, are also discussed. Written by experts with first-hand experience in AI-based EW, this is the first book on in-mission real-time learning and optimization.
