Jean Watson's Theory of Human Caring (Caritas) is now used in approximately 300 health care institutions in the United States and other institutions worldwide. This is the first international compendium of Caritas research, presenting the findings of 41 studies from 7 countries. The book examines similarities and differences in the ways in which each country applies Watson's Theory and documents the outcomes of these interventions. It addresses relationships between nurses and patients, nurses and their colleagues, self-care, and how Caritas is used to resolve outcome issues system-wide. The book discusses at length eight different Caring Factor surveys, primary research tools for those using the Caritas process, which identify constructs that either support or impede caring in multiple settings. The first section focuses on the theoretical underpinnings of Caritas and presents seven adaptations of the Caring Factor Survey. Section II addresses measurements and methods for facilitating a caring relationship between nurse and patient. Measurements and interventions to facilitate Caritas in a variety of settings is the focus of Section III, and the final sections address the international measurement and international comparisons of Caritas. The volume will be an important resource for nurse leaders, educators, administrators in academia including unit managers, and for hospitals with or seeking Magnet status. The book serves as a complement to Watson's *Assessing and Measuring Caring in Nursing and Health Care* and *Creating a Caring Science Curriculum: An Emancipatory Pedagogy for Nursing*. A co-publication with the Watson Caring Institute, this volume: Presents cutting-edge tools derived from the Caring Factor Survey for measuring caring in multiple contexts Discusses similarities and differences in caring contexts across nations Documents outcomes of Caritas in varied settings in the United States and internationally Addresses nurse-patient and nurse-colleague relationships, self-care, and resolution of system-wide outcome issues

Nurses who conduct research have a longstanding interest in questions of nursing knowledge. Nursing Knowledge is a clear and well-informed exposition of the philosophical background to nursing theory and research. Nursing Knowledge answers such fundamental questions as: How is nursing theory related to nursing practice? What are the core elements of nursing knowledge? What makes nursing research distinctive as nursing research? It examines the history of the philosophical debates within nursing, critiques the arguments, explains the implications and sets out to rethink the

philosophical foundation of nursing science. Nursing Knowledge begins with philosophical problems that arise within nursing science. It then considers various solutions with the help of philosophical ideas arguing that nurses ought to adopt certain philosophical positions because they are the best solutions to the problems that nurses encounter. The book argues that the nursing standpoint has the potential to disclose a more complete understanding of human health than the common disease-and-dysfunction views. Because of the relationship to practice, nursing science may freely draw theory from other disciplines and nursing practice unifies nursing research. By redefining theory and philosophy, With a new philosophical perspective on nursing science, the so-called relevance gap between nursing theory and practice can be closed. The final chapter of the book 'redraws the map', to create a new picture of nursing science based on the following principles: Problems of practice should guide nursing research Practice and theory are dynamically related Theory research must provide the knowledge base necessary for nurse interventions, training, patient education, etc. Nursing research should develop midrange theories and its results are nursing theory is strengthened when it uses theories confirmed by is integrated with other disciplines Key features Clear and accessibly written Accurate and philosophically well-informed, Discusses philosophical problems in contexts familiar to nurses Systematically examines the philosophical issues involved in nursing research Examines epistemology (how we know what we know), theory development, and the philosophical foundations of scientific methodology. "An additional assumption was that the processes for theory development were new to nursing and hence, nurses in graduate programs learned strategies for advancing knowledge from other disciplines. This assumption was debunked with the knowledge that nurses were always engaged in knowledge development, driven by their experiences in clinical practice. Because of these assumptions, most of the early writing about theory development was about outlining strategies that should be used, rather than strategies that have already been used in the discipline to develop theories. Theorists themselves did not uncover or adequately discuss ways by which they developed their theories, therefore the tendency was to describe processes that were based on theories developed in other disciplines, mainly the physical and social sciences. And an implicit assumption was made that there should be a single strategy for theory development, some claiming to begin the process from practice, and others believing it should be driven by research"--Provided by publisher.
