Design Integration Using Autodesk Revit 2017

Design Integration Using Autodesk Revit 2017 is designed to provide you with a well-rounded knowledge of Autodesk Revit tools and techniques. All three disciplines of the Revit platform are introduced in this textbook. This approach gives you a broad overview of the Building Information Modeling (BIM) process. The topics cover the design integration of most of the building disciplines: Architectural, Interior Design, Structural, Mechanical, Plumbing and Electrical. Civil is not covered, but adding topography to your model is. Each book comes with access to numerous video presentations of the written material as well as bonus chapters. Throughout the book you develop a two story law office. The drawings start with the floor plans and develop all the way to photo-realistic renderings similar to the one on the cover of this book. Along the way the building's structure, ductwork, plumbing and electrical (power and lighting) are modeled. By the end, you will have a thorough knowledge of many of the Revit basics needed to be productive in a classroom or office environment. Even if you will only be working with one component of Revit in your chosen profession, this book will give you important knowledge on how the other disciplines will be doing their work and valuable insight into the overall process. The first four chapters cover many of the Revit basics needed to successfully and efficiently work with the software. Once the fundamentals are covered, the remaining chapters walk you through a building project which is started from scratch so nothing is taken for granted by you or the author.

Discover how to efficiently take a model from Autodesk Revit into Autodesk 3ds Max. In this course, Adam Crespi goes beyond basic exporting and importing to show a streamlined workflow that optimizes Revit models for flexibility in rendering and design with 3ds Max. As part of this workflow, Adam covers optimizing a Revit model for export, breaking up large meshes, and best practices for export. In 3ds Max, he discusses importing a Revit model, applying smoothing groups, adjusting UV coordinates, integrating substances, fine-tuning materials, and creating test renderings.

Due to its comprehensive tool-set and great potential for 3D modeling, more and more architectural design and interior design firms are adapting Autodesk Maya and integrating it into their practice. There has been no book aimed at architects and designers who wish to harness the opportunities presented by this software, until now..... The book promotes parametric design. It integrates the theoretical research of computational design and Maya non-linear modeling techniques associated with simulation, animation, digital fabrication and form-finding within 2D & 3D design. Readers will learn: How to use Maya polygon and NURBS modeling tools to create non-linear procedural model. How to use Maya driver keys and relationship tools to generate parametrically negotiable solutions across various design professions. The design logic and generative processes, as well as the potential of parametric thinking as a resourceful tool for achieving diversity and complexity in form generation and fabrication. How to use Maya to prepare files for rapid prototyping and the integration of Maya into various fabrication techniques such as laser cutting, CNC milling, and 3D printing. How to create a digital simulation to simulate all aspects of surface properties and dynamic forces with Maya physics engine. How to use Maya skeleton system and animation tools to control complex architectural forms. How to create photo-realistic renderings with Maya lighting, material and texture mapping. Using several real projects as examples, the book will go through the entire rendering process step by step. How to combine Maya with various CAD/BIM tools to create an efficient design pipeline. How to use Maya MEL script to create customized tools and interface. The book includes case studies from Zaha Hadid Architects, Greg Lynn Form, Gage Clemenceau Architects, Tang & Yang Architects, as well as step by step exercises, demonstration projects and crucially a fantastic online resource which includes video tutorials, scripts, and Maya source files.

The "Design Assistance" module took advantage of the Autodesk Revit API to provide the designers with off-the-shelf LEED knowledge built into the BIM software to ensure the design was LEED-oriented. The "Certification Management" module was a web application built upon the Apache/MySQL/PHP platform that focused on managing project information, LEED documentation and submittals for the certification purpose. Finally, the LEED Materials and Resources use case was created to preliminarily validate the application model by simulating the LEED project delivery process. Overall, this research proposed and demonstrated that the BIM-LEED integration was feasible with considerable constraints. The integration should accommodate the needs of different team members with specialized assistance at different stage of the project delivery process. New functionalities of BIM software solutions and better support for information exchange at the database level would facilitate more rigorous implementation of BIM in green building certification.

Selection of materials for building design is a delicate process hinged of a number of factors which can be cost or environmental related, depending on the objectives of the design. This process becomes more difficult when designers are faced with several material options for each building component. This thesis presents the design and development of a framework that enables designers understand the trade-off between cost and environmental related factors when selecting materials for building design. The framework is based on the integration of Autodesk Revit, Microsoft access, and modeling modified Harmony search multi-objective optimization tool adapted to account for material and supplier selection. The cost and environmental related data sources include RSMeans for material cost, Google map for computing the distance between the location of the material suppliers and the project site. The functionality of the developed system is illustrated using a case study project.
