In covering the topic of gynecologic and obstetric pathology, this book attempts to carve out its own niche midway between an atlas and a traditional textbook. The gross and microscopic images in this atlas are presented exclusively in color, and are supplemented by pertinent clinical information and discussions of differential diagnostic considerations. When deemed appropriate, images of immunohistochemical and special stains are included. To further enhance their visual appeal and the overall learning experience, many images in this book are presented with annotations and/or in composite form, and selected images have been enlarged. This image-intensive textbook also includes numerous Pap smear images and cytologic-histologic correlations. In addition to coverage of pathology of the organs of the female genital tract, brief overviews of the normal histology of these sites are provided as necessary background information. Separate chapters are also devoted to placental and peritoneal pathology. There is an emphasis on diagnostic-related issues pertaining to common lesions and their variants, although classic forms of rare lesions are also presented. In selected instances, recommendations on the processing of gross pathology specimens, discussions regarding the optimal approach for intraoperative consultations, and recommendations on the phrasing of key portions of pathology reports are provided. The 10 chapters of this book are organized by site, and the beginning of each chapter lists the entities discussed and their corresponding page numbers.

In recent years new, obscure or poorly known dermatological disorders have been described and better defined, with emphasis on clinical, histopathological and etiopathogenetic features. Familiarity with these new, emerging or revisited clinical entities is fundamental, and recognizing them with their differential diagnosis has important implications in clinical practice for better patient management. This book offers an in-depth discussion of the clinical and pathologic features of newly described or less well-known and revisited cutaneous disorders. It provides clinical findings, as well as the histologic, immunologic, and molecular features of these diseases in addition to therapeutic notes. The first section of the book covers cutaneous diseases that lack any systemic implications, such as circumscribed palmoplantar hypokeratosis, necrotizing infundibular crystalline folliculitis, and dermal hyperneury, amongst others. The second section offers coverage on cutaneous diseases with systemic implications, such as AESOP-POEMS syndrome, lipoatrophic panniculitis of children, and obesity associated with lymphedematous mucinosis. Each chapter describes an entity, along with an atlas of clinical manifestations that will serve as a "bed-side" clinical reference, followed by a series of photomicrographs depicting the histologic changes. Chapters also offer recent updates on molecular tools helpful in attaining the diagnosis as well as therapeutic recommendations based upon the more recent acquisitions. New and Emerging Entities in Dermatology and Dermatopathology is a must-have reference for the practicing dermatopathologist, internists, general pathologist reviewing skin biopsies, general dermatologists, family practitioners and nurse practitioners, geneticists, immunologists and other health care providers that care for patients with skin conditions.

The burden of cutaneous drug reactions is significant, in both outpatient and inpatient settings, and can result in morbidity and even mortality. This book is unique in its approach to this problem. This text is divided into basic principles, common drug reactions, skin conditions mimicked by drug reactions, drug reactions to the skin appendages, life-threatening drug reactions, less common drug reactions, and special groupings of drug reactions. For the clinician, the skin can only morphologically react in to many limited ways. This is also true for the pathologist. Combining these two forever linked specialties is a synergistic paradigm that greatly enhances diagnosis, and ultimately therapy, for these pernicious conditions. Drug reactions in the skin remain a common complication of therapy. True incidences of drug reactions are not available. For general discussion, the rule of 3% can be applied with reasonable assuredness. Approximately 3% of all hospitalized patients develop an adverse cutaneous drug reaction. Approximately 3% of these reactions are considered severe. Outpatient data is even more obscure, but at least 3% of dermatology clinic outpatient visits are due to a drug reaction. Cutaneous drug reactions compromise approximately 3% of all drug reactions. Even more challenging is the fact that the most vulnerable populations to drug reactions are increasing and include the elderly patients on prolonged drug therapy, and patients that use multiple drugs at the same time.

Neoplastic mimics or ipseudotumors can simulate neoplasms on all levels of analysisóclinical, radiologic, and pathologicóand thus represent particular diagnostic pitfalls for the pathologist that can ultimately lead to therapeutic misdirection. Hundreds of color images and analysis of diagnostic mimics guide the pathologist through recognizing and distinguishing the unusual variants, morphologic anomalies, and misleading features that may easily lead to an inaccurate interpretation and missed diagnosis. Since many of the entities described are uncommon, Neoplastic Mimics in Dermatopathology emphasizes imaging and clinical correlations throughout to support the pathologist as consultant to the entire diagnostic and clinical management team. Every pathologist who sees skin cases will find this book an invaluable working tool to ensure accurate diagnosis. This book provides the pathologist with detailed morphologic descriptions and diagnostic guidance in recognizing these neoplastic mimics as they occur in the skin. In addition, descriptions and diagnostic guidance are provided for the range of skin lesions that may mimic benign masses but are in fact neoplastic. Because inflammatory skin disorders represent the most common and significant non-neoplastic skin diseases, as well as the most frequently encountered diagnostic hurdle for the practicing pathologist, they are the focus of this volume. This Atlas seeks to summarize and illuminate relevant clinical and pathologic findings for non-neoplastic disorders of skin in the context of recent knowledge and in a manner that promotes practicality. Non-neoplastic diseases of the skin are ubiquitous and numerous. They are responsible for significant morbidity in patients worldwide and account for enormous time consumption and cost within the medical community. The authors hope that this Fascicle will facilitate the diagnosis and treatment of these important conditions in a manner that will benefit patients and clinicians alike.
