In The New Meaning of Educational Change Fullen wrote, Low morale, depressed, feeling unfairly blamed for the ills of society? You must be a teacher. This quote spoke volumes to me as I watched politicians jockeying for position by spewing their recycled political rhetoric, and then launch an all out attack against public school teachers. In years past these attacks had been levied against those receiving social security, Medicare and Medicaid which mainly affected the poor, disabled and elderly. Dont get me wrong these issues are still on the table, but I guess politicians felt they had beaten them with a dead horse and needed another soft target to spark the publics interest so public school teachers was it. They struck with a vengeance firing public school teachers by the thousands throughout the country. In an attempt to reduce the collective bargaining power of teacher unions, such as American Federation of Teacher (AFT) in Texas they claimed the only way they knew to help balance the state and district school budget shortfalls was to rescind some of the benefits they had agreed too. It hurts when the profession Ive dedicated over half of my adult life (25 yrs.) to; is under attack by politicians and others that have no true concept of whats involved in being a public school teacher. We have absolutely nothing to do with the decision making process. First were told to do one thing and then were told to do something entirely different. Its almost schizophrenic. To all of my colleagues that remain on the frontlines of public education and those that are planning to take up the banner This books for you. You might not have control over the decisions being made outside your classroom, but you can control those things going on inside. I provide ways to control student behavior by the design of your classroom to the use of a simple yellow tablet.

Minilessons for Early Multiplication and Division is one of two yearlong resource guides in Contexts for Learning Mathematics' Investigating Multiplication and Division (3-5) Minilessons for Early Multiplication and Division is a resource of 75 minilessons that you can choose from throughout the year. In contrast to investigations, which constitute the heart of the math workshop, the minilesson is more guided and more explicit, designed to be used at the start of math workshop and to last for ten to fifteen minutes. Each day, no matter what other materials you are using, you might choose a minilesson from this resource to provide your students with experiences to develop efficient computation. You can also use them with small groups of students as you differentiate instruction. The minilessons in this guide were

designed to be used in grades 3-4. Some of the minilessons use pictures of realistic situations, carefully crafted to support the development of specific strategies that can be helpful in automatizing the facts. Others make use of quick images with ten-frames and arrays. Flashed for only a few seconds, the images encourage children to give up trying to count each item and instead to use five-times and tentimes as helpful partial products. Other minilessons are crafted as a tightly structured series, or "string," of computation problems designed to encourage children to look to the numbers first, before they decide on a computation strategy. The strings are likely to generate discussion on certain strategies or big ideas underlying an understanding of early multiplication and division. This book brings together ideas from experts in cognitive science, mathematics, and mathematics education to discuss these issues and to present research on how mathematics and its learning and teaching are evolving in the Information Age. Given the ever-broadening trends in Artificial Intelligence and the processing of information generally, the aim is to assess their implications for how math is evolving and how math should now be taught to a generation that has been reared in the Information Age. It will also look at the ever-spreading assumption that human intelligence may not be unique—an idea that dovetails with current philosophies of mind such as posthumanism and transhumanism. The role of technology in human evolution has become critical in the contemporary world. Therefore, a subgoal of this book is to illuminate how humans now use their sophisticated technologies to chart cognitive and social progress. Given the interdisciplinary nature of the chapters, this will be of interest to all kinds of readers, from mathematicians themselves working increasingly with computer scientists, to cognitive scientists who carry out research on mathematics cognition and teachers of mathematics in a classroom.

In this resource book, there are 64-timed drills/exercises designed specifically to bring about significant improvement in the efficiency (both accuracy and speed) of students' basic math computational skills. Basic computational skills (addition, subtraction, multiplication, and division) involving simple whole numbers, particularly the mastery of multiplication tables with accuracy and instinctive responses, provide the building blocks of mathematics. These skills are the basic framework of the "language" of math. Students who have not developed efficiency (both accuracy and speed) in basic math computational skills are limited in their ability to succeed in math, particularly algebra which research has shown to have a substantial correlation with students successfully enrolling in four-year colleges .

The Portfolio Organizer stands out as a superb contribution to the vital field of accountability for learning. This book is distinguished by the presence and integration of a conceptual framework and a superb array of practical examples. Nearly every key issue is anticipated and addressed in this accessible and clear treatment of a complex topic. The reason that this book is so good is that the authors have been immersed in pioneering work on portfolios for a decade. They have developed their ideas through work with their own students, and through a wide range of research and evaluation projects including new initiatives involving elementary and secondary school students, initial preparation of teachers, and continuous professional development of teachers and administrators. They have learned by grappling with the complex issues of introducing evaluation that simultaneously serves improvement and accountability goals. The result is a great practical book that can help educators develop their understanding and

use of portfolios as a route to reform. This book provides educators with a flexible framework to guide decision making for effective and efficient use of portfolios in classrooms and schools. It is designed to assist classroom teachers, administrators, staff developers, and university professors in identifying, organizing, and acting upon the many challenges and possibilities inherent in portfolio implementation. Specifically, The Portfolio Organizer targets the major categories of decision making and assists teachers in making decisions about effective portfolio implementation in classrooms. In addition, the book addresses professional portfolios and can be used by educators to develop and maintain their own portfolios.-(From the Foreword by Michael Fullan).
