Your company is turning in regular profits every year, and its market share is only getting bigger. Competitors can't touch you. So why is your stock price so sluggish? The answer is as simple as it is cruel: investors aren't interested in history, and they already know you're profitable and competitive—that knowledge is baked into your stock price. The hard reality is that a competitive advantage just isn't

enough. Investors want companies to surprise them with unexpected value, which means that you can outperform market expectations only if you as a leader know how to find, create, and deliver a series of multiple competitive advantages. This is why a corporate theory is so important. A good corporate theory provides a compass for those at the strategic helm, guiding their decisions about what assets and activities to pursue, what investments to make, and what strategies to adopt. Behind every long-term corporate success story lies a basic theory about how that company creates value. In *Beyond Competitive Advantage*, strategy professor Todd Zenger describes what makes a great corporate theory and helps readers understand the many tensions and trade-offs they'll face as they apply the theory to meet the challenge of market expectations. Based on years of research and analysis, *Beyond Competitive Advantage* provides managers and executives with a framework for both sustaining value and creating growth.

An insider's guide to understanding and eliminating accounting fraud How do these high-profile accounting scandals occur and what could have been done to prevent them. Hidden Financial Risk fills that void by examining methods for off balance sheet accounting, with a particular emphasis on special purpose entities (SPE), the accounting ruse of choice at Enron and other beleaguered companies. J. Edward Ketz identifies the incentives for managers to deceive investors and creditors about financial risk and also shows investors how to protect their investments in a world filled with accounting and auditing frauds. J. Edward Ketz, PhD (State College, PA) is MBA Faculty Director and Associate Professor of Accounting at Penn State's Smeal College of Business. He has been cited in the press nearly 300 times since Enron's bankruptcy, including The New York Times, The Wall Street Journal, and The Washington Post.. He has a regular column in Accounting Today.

A few years ago, Americans held out their systems of corporate governance and financial disclosure as models to be emulated by the rest of the world. But in late 2001 U.S. policymakers and corporate leaders found themselves facing the largest corporate accounting scandals in American history. The spectacular collapses of Enron and Worldcom—as well as the discovery of accounting irregularities at other large U.S. companies—seemed to call into question the efficacy of the entire system of corporate governance in the United States. In response, Congress quickly enacted a comprehensive package of reform measures in what has come to be known as the Sarbanes-Oxley Act. The New York Stock Exchange and the NASDAQ followed by making fundamental changes to their listing requirements. The private sector acted as well. Accounting firms—watching in horror as one of their largest, Arthur

Andersen, collapsed after a criminal conviction for document shredding—tightened their auditing procedures. Stock analysts and ratings agencies, hit hard by a series of disclosures about their failings, changed their practices as well. Will these reforms be enough? Are some counterproductive? Are other shortcomings in the disclosure system still in need of correction? These are among the questions that George Benston, Michael Bromwich, Robert E. Litan, and Alfred Wagenhofer address in *Following the Money*. While the authors agree that the U.S. system of corporate disclosure and governance is in need of change, they are concerned that policymakers may be overreacting in some areas and taking actions in others that may prove to be ineffective or even counterproductive. Using the Enron case as a point of departure, the authors argue that the major problem lies not in the accounting and auditing standards themselves, but in the system of enforcing those standards. Rather than attempting to craft a single set of accounting and reporting standards for all companies throughout the world, the authors advise policymakers to allow competition between the two major sets of standards: Generally Accepted Accounting Principles and International Financial Reporting Standards. The authors also believe that the corporate disclosure system needs to be updated to reflect changes in the underlying economy. In particular, they recommend new forms of disclosure for a variety of nonfinancial indicators to better enable investors and analysts to ascertain the source and nature of intangible assets. They also urge policymakers to exploit the advantages of the Internet by encouraging more frequent financial disclosures in a form that will make them more widely accessible and more easily used.

Corporate scandals due to bad accounting happen far too frequently for a system of corporate

governance to be deemed effective. This book tells why the safeguards designed to prevent bad accounting so often fail. By studying why the auditors and members of a board of directors regularly fail to deliver the truth about a company's financial state of affairs, this provocative book explores a serious problem in the system of reporting financial information. This book is unique in that it draws together various strands of the literature on corporate governance, accounting, law, cognitive research, psychology, behavioural economics and conventional economics to shed light on questions regarding the feasibility of independence and impartiality of boards of directors and external auditors as monitors and gatekeepers in corporate governance. The book is essential reading for professional accountants and auditors, directors, regulators, law makers, corporate lawyers, and investment bankers. It will appeal to all those interested in behavioural economics and corporate governance.

This book is intended for the students and teachers of evidence based decision making, especially when the evidences are obtained from numerical facts. It specifically covers business modeling, decision analytics, and forecasting. All planning and decision making start with some estimation of what the future holds for a business and thus, we need to forecast the future. Generally, there can be more than one forecast for most real situations based on the model one uses to forecast them. Business modeling can help us with calculating what those multiple forecasts of the future mean for the things that the business is interested in, such as profit, costs, pay off, returns etc. These are also called outcomes. Once we get the forecasts depicting the future, we can devise and assess multiple actions, and choose one of them that get the best outcome for the business. Decision analytics help us with this assessment. This book is best used for problem based learning and instruction. Problem based learning introduces the problem first for the students to work on, along with

the instructor. Students learn by doing. They can practice multiple problems for practice until the underlying principles and lessons are understood and absorbed. Then the formal theories and principles are presented to make sense of what the students have already done and learned. This can also be called reversed learning because it reverses the process of the traditional learning method of theory first and problem solving later. The first of the book provides the problem and the second half of the book provides brief theories and principles, and solutions of the problems.
