Written by a foremost expert in the field, this hands-on, evidence-based guide describes how to conduct a comprehensive forensic neuropsychological evaluation and provide expert testimony. All steps are covered--from selecting, scoring, and interpreting tests to writing reports and responding to cross-examination--with special attention to assessing noncredible performance. The book identifies seven common flaws of forensic neuropsychological reports and shows how to avoid them. Excerpts from testimony transcripts illustrate ways neuropsychologists can protect their reports from attack. Also featured are case illustrations and a sample report.

Revised to reflect DSM-5, this briefer version of Durand and Barlow's widely taught text fully describes abnormal psychology through the authors' standard-setting integrative approach--the most modern, scientifically valid method for studying the subject. Through this approach, students learn that psychological disorders are rarely caused by a single influence, but rooted in the interaction among multiple factors: biological, psychological, cultural, social, familial, and even political. A conversational writing style, consistent pedagogy, and real case profiles--95 percent from the authors' own case files--provide a realistic context for the scientific findings of the book. In addition, these features ensure that readers never lose sight of the fact that real people are behind the DSM-5 criteria, the theories, and the research. "It is one matter to forget things when you have a million thoughts flooding your mind and quite another to forget when your head is as empty as a looted store." -from *Remind Me Why I'm Here* In the spring of 1996, Diana Lund was a top-ranked project manager in her mid-thirties when a car accident instantly changed her personality and her life's direction. Thrust into short-term memory loss and cognitive deficit, self-perception kept colliding into reality. Neurologists underestimated her difficulties; they sent her back to work, to manage multi-million dollar contracts, in a mentally compromised state. Beyond an account of devastating internal transformation, *Remind Me* delves into neurological research and trends. Lund pushes her intellect to its limit to unravel mysteries about her brain and accident. And on her quest to become whole again and to understand the neurological world, she discovers hope. "A topic that could be dense and heavy becomes a page turner. Even sophisticated professionals can relate to the freshness of observations . . ." -Leonard Diller, PhD, Prof. of Rehabilitation Medicine, NYU School of Medicine; Director of

Psychology, Rusk Institute of Rehabilitation Medicine "A superbly written volume . . . illustrating . . . that even so-called minor brain injuries can produce functionally incapacitating cognitive and neurobehavioral impairments . . ." -Yehuda Ben-Yishay, PhD, Prof. of Clinical Rehabilitation Medicine, NYU "Essential reading for clinicians, families, and counselors." -Marilyn Lash, MSW, Partner, Lash and Associates Publishing/Training, Inc.

Increased public awareness of traumatic brain injuries has fueled a number of significant developments: on the one hand, more funding and more research related to these injuries and their resulting deficits; on the other, the possibility of higher stakes in personal injury suits—and more reasons for individuals to feign injury. Expanding both the conceptual and clinical knowledge base on the subject, the Second Edition of *Detection of Malingering during Head Injury Litigation* offers the latest detection tools and techniques for veteran and novice alike. As in its initial incarnation, this practical revision demonstrates how to combine clinical expertise, carefully-gathered data, and the use of actuarial models as well as common sense in making sound evaluations and reducing ambiguous results. And, the book navigates the reader through the many caveats that come with the job, beginning with the scenario that an individual may be malingering despite having an actual brain injury. Among the updated features: •Specific chapters on malingering on the Halstead-Reitan, Luria-Nebraska, and MMPI-2. •A framework for distinguishing genuine from factitious PTSD in head injury cases. •Detailed information regarding performance on the WMT, MSVT, and NV-MSVT by children with developmental disabilities. •Guidelines for explaining symptom validity testing to the trier of fact. •Entirely new chapters on mild TBI and on malingering of PTSD symptoms in the context of TBI litigation. Professional neuropsychologists and forensic psychologists will appreciate this new edition of *Detection of Malingering during Head Injury Litigation* as an invaluable source of refinements to their craft, and improvement as an expert witness.

With the growth of threats and violence in higher education settings, college campuses are increasingly expected to have systems in place to identify potentially aggressive individuals and intervene to ensure the safety of the campus population. This book will be useful for student affairs professionals as well as college counselors, psychologists, social workers interested in the practical management of aggression and violence on a college campus. It will also be a valuable resource for those involved in creating and running behavioral intervention teams and threat/risk assessment teams. Ten case studies from both the community and residential college settings provide a comprehensive overview of campus violence and how to intervene to prevent it. Pertinent background information is discussed as an introduction to these narratives, such as the fundamentals of aggression and violence on campuses; how these behaviors can impact students, faculty, and staff; and what can be learned from past campus violence. Along with discussion questions and a review of ways to approach each situation, experts in higher education, forensic risk assessment, law enforcement, and legal issues weigh in on each case study. Their perspectives offer a context and broad base of opinions and ideas on how each case could be handled. Additional examples for further training of the college counselor are given through a detailed look at almost 100 incidents of violence, including thwarted attacks, rampage shootings, and hostage situations. *Lethal Violence: A Sourcebook on Fatal Domestic, Acquaintance and Stranger Aggression* applies the lethal violence sequence

analysis to a wide-ranging array of fatal aggression, resulting in a multitude of observations and principles of violence. This sourcebook provides base rate information and cases for each type of fatal interaction, then applies the knowledge to violence-related situations and settings.

Greater Understanding, Better Evaluations Today's increasingly sophisticated psychological and neuropsychological assessments allow for greater understanding and evaluations in forensic psychology. By integrating discussions of modern psychological and neuropsychological tests with extant civil and criminal cases, this book presents a unique resource for insight into the impact of modern behavioral science on the legal system. Foundational, Criminal, and Civil Issues Divided into three parts, this timely compilation of articles from national and international experts begins with foundational issues such as the legal, ethical, and applied aspects of mitigation evaluations. It examines violence prediction and risk analysis, violence in the family, and the detection of malingering and deception in forensic evaluations. Part 2 looks at the psychological issues found in criminal forensic evaluation. This section discusses assessments of competence to stand trial, mitigatory defenses, and hostage negotiation, as well as the psychological impact of officer-involved shootings. The final part focuses on neuropsychological evaluation as it is relevant to civil cases including worker's compensation, malingered pain and memory deficits, and parental assessment in child maltreatment cases. Template Case Studies Providing several full case studies in more than a dozen appendices, this book addresses both psychological and neuropsychological concepts in the context of the legal system and allows for a practical understanding and application of behavioral, legal, and ethical issues in civil and criminal cases.

The establishment of frank and honest communication is one of the most important early goals of psychotherapy. Indeed, the most prominent challenge in the early stages of treatment is to develop a comfortable relationship that allows disclosure. In this volume, the authors show that objectively interpreted personality measures can be applied in psychotherapeutic assessments to facilitate an understanding of the patient and a thriving treatment program. Successful psychotherapy depends upon an early understanding of the patient's problems and personality and the establishment of attainable treatment goals. The extensive accumulated base of knowledge about personality and its maladjustment has become crucial when making treatment decisions about individuals in psychotherapy, and the field of personality assessment provides both methods and substantive information to support treatment-oriented evaluation. The MMPI has a long tradition of providing personality information about clients in mental health settings since the 1940s. James Butcher participated in the creation of the Minnesota Multiphasic Personality Inventory (MMPI-2) in 1989, which has continued to be one of the most commonly used personality tests in clinical evaluation. Over a thousand studies have been conducted on the effectiveness of the MMPI in treatment related assessments. Here, Butcher and co-author Julia

Perry explore the MMPI-2 as well as a new assessment tool, the Butcher Treatment Planning Inventory (BTPI). In using psychological evaluation techniques for treatment planning, many clinicians incorporate information from a broad base of instruments-clinical interview, projective testing, behavioral data, and personal history-and do not rely on data from a single source. Therefore, while this volume focuses on the use of the MMPI-2 and the BTPI in treatment planning, it will provide a context not to the exclusion of other measures.

Oxford Handbooks offer authoritative and up-to-date reviews of original research in a particular subject area. Specially commissioned chapters from leading figures in the discipline give critical examinations of the progress and direction of debates, as well as a foundation for future research. Oxford Handbooks provide scholars and graduate students with compelling new perspectives upon a wide range of subjects in the humanities, social sciences, and sciences. As one of psychology's oldest fields, personality assessment is one of the most extensively studied subsets of contemporary psychology. The Oxford Handbook of Personality Assessment synthesizes new and existing literature with clinical practice to provide a comprehensive volume on contemporary personality assessment, including its historical developments, underlying methods, applications, contemporary issues, and assessment techniques. This handbook, part of the Oxford Library of Psychology, addresses both the historical roots of personality assessment and the evolution of its contemporary methodological tenets, thus providing a foundation for the handbook's other innovative focus: the application of personality assessment in clinical, personnel, and forensic assessments. With a wealth of respected international contributors and unequalled breadth of content, the Oxford Handbook of Personality Assessment offers an authoritative and field-encompassing resource for researchers and clinicians from across the medical health and

psychology disciplines (i.e., clinical psychology, psychiatry, and social work) and would be an ideal text for any graduate course on the topic of personality assessment.

Forensic mental health assessments are evaluations conducted by individuals from different disciplines on a variety of questions in civil, criminal, and family law. A growing number of mental health professionals, including psychologists, psychiatrists, and social workers, are being called upon to assess everything from an individual's competence to stand trial to the risk or threat of future violence, and asked to weigh in on cases ranging from murder and assault to malpractice and child custody." General principles have emerged to guide professionals conducting forensic mental health assessment. Forensic Mental Health Assessment: A Casebook illustrates those principles using relevant, real-world case material. Built around actual case reports from expert forensic psychologists and psychiatrists, the volume probes a broad range of legal questions through the detailed examination of more than 40 cases. Topics include Miranda rights waiver, competence to act as one's own attorney, competence to stand trial, juvenile commitment, sanity at the time of the offense, child custody, termination of parental rights, guardianship, and malpractice. This is the first casebook focusing specifically on forensic assessment. It contains cases from a broad range of civil, criminal, and family legal questions, described in case reports contributed by expert forensic psychologists and psychiatrists. It will be useful for anyone involved in assessments for the courts and attorneys, including psychologists, psychiatrists, social workers, and attorneys.

Material presented in many testing books is appropriately broad and comprehensive, but the effect for students new to testing is difficulty in then translating the extensive information into the practical skills of administering, scoring, and interpreting tests to help inform the treatment process. Few resources exist to help students and mental health clinicians with the daunting task of learning how to synthesize test data from numerous instruments into a meaningful treatment plan and strategy for a client. This book was written to address that need. It takes readers through a systematic

explanation of how to understand and integrate data from multiple sources to maximize the information gleaned from the tests. It also emphasizes using test data to maximize helpfulness to the client and how to interpret test data to clients in language that is understandable.

The purpose of this book is to provide a firm basis for psychologists to understand the appropriate uses and limitations of popular clinical assessment measures as they are applied to forensic issues. The instruments were selected because of their wide use and importance in both clinical and forensic settings. The PCL-R, the PAI, and MCMI-II, for example, are typically used with adults in criminal evaluations; the MMPI-A is often used in evaluating adolescents in detention and correctional facilities; while the Child Behavior Checklist (CBCL) (Achenbach, 1991), Personality Inventory for Children--Second Edition (PIC-2) (Lachar & Gruber, 2001), and Parenting Stress Index (PSI) (Abidin, 1995) are more commonly used in evaluating families involved in child protection and custody cases. Instruments such as the MMPI-2, the Rorschach, and the Halstead-Reitan Neuropsychological Battery are widely used across many types of forensic evaluations, although the latter category of testing is particularly related to personal injury evaluations. The end result is a unique and indispensable reference: a comprehensive overview, within a single text, of prominent clinical assessment instruments widely used for forensic purposes and designed to facilitate the optimal use of clinical assessment instruments among psychologists who have undertaken the training necessary to understand and apply psychological principles and test findings to salient legal standards or issues.

A complete, thorough, and pragmatic guide to clinical assessment, this authoritative book meets a key need for both students and practitioners. T. Mark Harwood, Larry E. Beutler, Gary Groth-Marnat, and their associates describe how to construct a "moving picture" of each patient by integrating data from a variety of sources. Included are detailed, systematic reviews of widely used instruments together with strategies for selecting the best methods for particular referral questions. Readers learn to conduct integrated assessments that take the complexities of the individual personality into account, serve as the basis for developing an effective treatment plan, and facilitate meaningful reporting and client feedback. New to This Edition *Incorporates the latest research findings and assessment/treatment planning tools. *Chapters on the Personality Assessment Inventory and the NEO-PI-R and NEO-PI-3. *A new extended case example runs throughout the chapters. *Critically evaluates the recently published MMPI-2-RF.

The Second Edition of this well-known Compendium has been considerably expanded and updated. It contains new chapters on test selection administration and preparation of the client; report writing and the informing interview; executive functions; occupational interest and aptitude; and malingering and symptom validity testing. The first four chapters focus on history taking, test selection, profiling of test results, report writing, and informing the client. The

remaining thirteen chapters contain nearly all the tests covered in the first edition plus almost the same number of new ones. Some of the new tests are: Kaufman-Brief Intelligence Test, Mini-Mental State Examination, Wechsler Individual Achievement Test, Design Fluency Test, California Verbal Learning Test, and Boston Diagnostic Aphasia Test. For each test, the authors provide a thorough description, source and price, instructions for administration, duration, scoring procedures, normative data, and validity information. They also discuss special tests and clinical techniques in examining the functional integrity of brain regions. The volume does not limit itself to the adult age range, but includes all the norms available for pediatric and gerontological populations, as well as neuropsychological tests developed specifically for children.
