This book presents an unprecedented qualitative research study on relational changes in mediation with a truly interdisciplinary outset, drawing on the literature on psychology, alternative dispute resolution and business. Mediation's potential to induce changes in parties' relationships as an advantage of the process is commonly mentioned in the literature. However, despite its being a key to reconciliation, relational changes in mediation has not yet been a topic of foundational and fine-grained qualitative enquiry. As the first study in the literature, this research uses in-depth interviews with mediation parties and the qualitative methodology of interpretative phenomenological analysis in order to explore participants' lived experiences. The phenomenological stance ensures a particularly rich data set and a nuanced interpretative analysis. This pioneering piece of research seeks to enter mediation parties' true experiences as closely as possible, moving beyond pre-existing theoretical, quantitative and large-scale qualitative explorations. The themes are discussed in the context of theory, research and practice. Therefore, this book advances knowledge about mediation both in theoretical and practical terms. Innovative conclusions and recommendations are provided for developing mediation practice, mediation training programmes, and further research.

Educational environments interact with children's unique genetic profiles, leading to wide individual differences in learning ability, motivation, and achievement in different academic subjects – even when children study with the same teacher, attend the same school and follow the same curriculum. This book considers how education can benefit from the recent progress in genetically informative research. The book provides new insights into the origins of individual differences in education traits such as cognitive abilities and disabilities; motivation and personality; behavioural and emotional problems; social functioning; well-being, and academic achievement. International Review of Research in Mental Retardation is an ongoing scholarly look at research into the causes, effects, classification systems, syndromes, etc. of mental retardation. Contributors come from wide-ranging perspectives, including genetics, psychology, education, and other health and behavioral sciences. Volume 28 of the IRRMR serial was guest edited by Harvey Switzky and devoted to personality and motivational systems of the mentally retarded. That volume focused primarily on goal-orientation and motivation in an educational context and the extent to which the social stigma and personality factors associated with mental retardation impact goal-orientation. In this second volume on personality and motivation, the focus is on theories of motivation, and how accurately they predict what we know about the life of the mentally retarded with respect to decision making, interpersonal relationships, depression, and adaptive behavior.

Abnormal Psychology: The Science and Treatment of Psychological Disorders consists of a balance and blending of research and clinical application, the use of paradigms as an organizing principle, and involving the learner in the kinds of real-world problem solving engaged in by clinicians and scientists. Students learn that psychopathology is best understood by considering multiple perspectives and that these varying perspectives provide the clearest accounting of the causes of these disorders as well as the best possible treatments.

This timely and important work looks at the collaborative health care model for the delivery of mental health care in a primary care setting. This has become the ideal model for the treatment of comorbid medical and psychiatric or psychological disorders. There is also an increased awareness that pharmacological intervention, the most frequently delivered intervention for psychological disorders, is often of limited effectiveness without concurrent specific psychological intervention. The book includes more than two dozen case studies, co-written by clinical psychologists and primary care physicians. It is essential reading for any psychology practitioner in a clinical setting, as well as for health care administrators.

How can we identify the young men and women who, as social and behavioral scientists of tomorrow, will do the needed research to resolve our burgeoning social problems? How can the most promising be attracted to an investigatory career? How can they become identified with the behaviors, attitudes and values that persons in science share? A provocative body of literature about the psychology of the scientist and his career emerged in the post-Sputnik era. Drs. Eiduson and Beckman bring together more than seventy of the most significant and representative studies. These range over childhood and family influences, academic experiences, motivations, interests, and intellectual and personality strengths that have been examined as precursors for choosing science as adult work. The psychological mechanisms involved in socializing a young person toward a scientific career are suggested in readings from the outstanding theoreticians in the field. Selections on scientific career lines, decisions and options at various stages of work, and factors influencing goals and career development contribute to the understanding of the psychological life of the highly endowed and well-functioning professional adult. Through showing the certain completeness of effort of what has been learned about the psychology of scientists to date, the authors anticipate a resurgence of interest in the creative individual, a renewed enthusiasm for application, and a refocusing of research on the issues unique to the social and behavioral research scientist.
