The PL/SQL programming language is at the core of most Oracle database applications. This training course will give attention to three fundamental pillars of effective implementation of PL/SQL applications. First, we will explore the advanced features of the language which allow powerful and adaptable database applications to be built. Next, we will discuss performance tuning techniques which allows these applications to run efficiently. Finally, we will consider critical security measures which should be implemented to counter hacker attacks and other security threats. Among the specific topics contained within these training materials are: Invoking external procedures and integrating these into PL/SQL applications. These include external Java classes using the JDBC interface and external C programs contained within DLL libraries; Using dynamic SQL to extend the functionality and flexibility of database programs, including the DBMS_SQL() system-supplied package for maximum flexibility; Identifying SQL injection attack vulnerabilities within an application and applying countermeasures to address security risks and protect against hacking; Incorporating collections and other advanced types into application logic to increase efficiency and execution speed; Working with LOBs, including piece-wise data manipulation and dynamic modification of SecureFile storage options; Expanding functionality with system-supplied database utility packages; Tuning with the DBMS_PROFILER() system-supplied package and debugging with the DBMS_TRACE() system-supplied package; Writing efficient PL/SQL code and avoiding common coding mistakes; Enabling native compilation and execution of all database-resident program units; Controlling and managing PL/SQL compilation for high-efficiency execution; Analyze PL/SQL code structure by means of the PL/Scope facility; Analyze PL/SQL application performance and tune bottlenecks using the PL/SQL Hierarchical Profiler; Implementing fine-grained security mechanisms as part of an advanced security model using application contexts and the Oracle virtual private database (VPD); Dynamic partitioning and DML parallelization using the system-supplied package DBMS_PARALLEL_EXECUTE(); Using the wrap utility to hide the source code of database-resident programs, even from the owner or authorized users of the programs.

ORACLE 11G: SQL is an introduction to the fundamental SQL language used in all relational databases today. This textbook is not simply a study guide; it is written for those who have just a basic knowledge of databases and can be used in a course on this latest implementation of SQL from Oracle. Learning these concepts and techniques prepares students for the first exam in both the Oracle Database Administrator and Oracle Developer Certification Exam paths and offers a solid understanding of using Oracle 11g SQL effectively. The first part of ORACLE 11G: SQL focuses on creating database objects, including tables, constraints, indexes, sequences, synonyms, and users, and manipulating data. The second part explores data query techniques, such as row filtering, joins, single-row functions, aggregate functions, subqueries, and views. Several advanced query topics, such as ROLLUP, CUBE, and TOP-N analysis, are also introduced. To help students bridge these SQL topics to further studies, appendixes introduce SQL tuning, compare Oracle's SQL syntax with other databases (MS SQL Server and MySQL), and explain how to embed SQL in applications (ASP.NET). An overview of the two Oracle connection interface tools, SQL Developer and SQL Plus, is also provided.
