Working from basic chemical principles, *Metals in Medicine* presents a complete and methodical approach to the topic. Introductory chapters discuss important bonding concepts applicable to metallo-drugs and their biological targets, interactions that exist between the agents and substances in the biological milieu, basic pharmacokinetic and pharmacodynamic properties including transport and uptake of drugs by the cells, and methods for measuring efficacy and toxicity of agents. The steps from drug discovery to market place are also briefly outlined and discussed. These chapters lay the groundwork, in order that students can clearly understand how agents work, whatever their subject background. Following this introduction, chapters focus on individual metallo-drugs and agents for treating and detecting disease, their synthesis, structure and general properties, known mechanism of action and important physical and chemical principles that apply. Topics covered include cisplatin; platinum anticancer drugs; ruthenium, titanium, and gallium for treating cancer; gold compounds for treating arthritis, cancer, and other diseases; vanadium, copper, and zinc in medicine;

metal complexes for diagnosing disease; and metals in nanomedicine. Throughout the book, "Feature Boxes" expand on features of drugs that are not directly related to studying metals in medicine, for example discovery, medical use, specialist assays, and metals in biology. At the end of the chapters there are specifically designed problems/exercises that apply basic kinetic, thermodynamic and chemical principles to practical problem solving in metals in medicine. Metals in Medicine distils the essence of this important topic for undergraduate and graduate students in chemistry, biochemistry, biology and the related areas of biophysics, pharmacology, and bioengineering, and for researchers in other fields interested in getting a general insight into metals in medicine.

The second edition of this textbook includes refined text in each chapter, new sections on corrosion of steel-reinforced concrete and on cathodic protection of steel-reinforced bars embedded in concrete, and some new solved examples. The book introduces mathematical and engineering approximation schemes for describing the thermodynamics and kinetics of electrochemical systems, which are the essence of corrosion science, in addition to electrochemical corrosion, forms of corrosion and mechanisms of corrosion. This approach should capture the reader's attention on the complexity of corrosion. Thus, the principles of electrochemistry and electrochemical cells are subsequently characterized in simple electrolytes from a thermodynamics point of view.

„Thermodynamik ist ein komisches Fach. Das erste Mal, wenn man sich damit befasst, versteht man nichts davon...“ Dieses Zitat des berühmten Physikers Arnold Sommerfeld spricht wohl vielen Studierenden der ersten Semester aus dem Herzen. In der Tat wirken die Vielzahl an thermodynamischen Größen wie Innere Energie, Enthalpie, Gibbs'sche Energie gerade für den Anfänger recht verwirrend. Zugegeben – Thermodynamik ist nicht einfach, und deshalb ist ein gutes Lehrkonzept besonders wichtig. Einerseits darf der Studierende nicht mit akademischen Definitionen und mathematischen Ableitungen erschlagen, andererseits aber auch nicht mit „Thermodynamik light“ mit trügerischem Halbwissen abgespeist werden. Das vorliegende Lehrbuch basiert auf jahrzehntelanger

Lehrerfahrung der Autoren und folgt dem von Carathéodory aufgezeigten Zugang zur Thermodynamik. Dieses in den traditionellen Lehrbüchern eher seltene Konzept stellt einen mathematischen Zusammenhang zwischen den zahlreichen thermodynamischen Größen her und hat bereits Albert Einstein begeistert.

This book presents the latest developments in Femtosecond Chemistry and Physics for the study of ultrafast photo-induced molecular processes.

Molecular systems, from the simplest H₂ molecule to polymers or biological macromolecules, constitute central objects of interest for Physics, Chemistry and Biology, and despite the broad range of phenomena that they exhibit, they share some common behaviors. One of the most significant of those is that many of the processes involving chemical transformation (nuclear reorganization, bond breaking, bond making) take place in an extraordinarily short time, in or around the femtosecond temporal scale (1 fs = 10⁻¹⁵ s). A number of experimental approaches - very particularly the developments in the generation and manipulation of ultrashort laser pulses - coupled with theoretical progress, provide the ultrafast scientist with powerful tools to understand matter and its interaction with light, at this spatial and temporal scale. This book is an attempt to reunite some of the

state-of-the-art research that is being carried out in the field of ultrafast molecular science, from theoretical developments, through new phenomena induced by intense laser fields, to the latest techniques applied to the study of molecular dynamics.

Modern Vibrational Spectroscopy and Micro-Spectroscopy: Theory, Instrumentation and Biomedical Applications unites the theory and background of conventional vibrational spectroscopy with the principles of microspectroscopy. It starts with basic theory as it applies to small molecules and then expands it to include the large biomolecules which are the main topic of the book with an emphasis on practical experiments, results analysis and medical and diagnostic applications. This book is unique in that it addresses both the parent spectroscopy and the microspectroscopic aspects in one volume. Part I covers the basic theory, principles and instrumentation of classical vibrational, infrared and Raman spectroscopy. It is aimed at researchers with a background in chemistry and physics, and is presented at the level suitable for first year graduate students. The latter half of Part I is devoted to more novel subjects in vibrational spectroscopy, such as resonance and non-linear Raman effects, vibrational optical activity, time resolved spectroscopy and computational methods. Thus, Part 1 represents a short course into modern vibrational spectroscopy.

Part II is devoted in its entirety to applications of vibrational spectroscopic techniques to biophysical and bio-structural research, and the more recent extension of vibrational spectroscopy to microscopic data acquisition. Vibrational microscopy (or microspectroscopy) has opened entirely new avenues toward applications in the biomedical sciences, and has created new research fields collectively referred to as Spectral Cytopathology (SCP) and Spectral Histopathology (SHP). In order to fully exploit the information contained in the micro-spectral datasets, methods of multivariate analysis need to be employed. These methods, along with representative results of both SCP and SHP are presented and discussed in detail in Part II.
