To obtain data about the stiffness and bearing capacity of a foundation pile, the Rapid Load Test could be an effective and economic alternative for a static load test. In order to judge this, the influence of rate effects in clay and pore water pressures in sand should first be understood. This book presents the latest developments in the research

This book, combining and updating two previous editions, is a unique source of information on the diagnosis, treatment, and follow-up of metabolic diseases. The clinical and laboratory data characteristic of rare metabolic conditions can be

bewildering for both clinicians and laboratory personnel. Reference laboratory data are scattered, and clinical descriptions may be obscure. The Physician's Guide documents the features of more than five hundred conditions, grouped according to type of disorder, organ system affected (e.g. liver, kidney, etc) or phenotype (e.g. neurological, hepatic, etc). Relevant clinical findings are provided and pathological values for diagnostic metabolites highlighted. Guidance on appropriate biochemical genetic testing is provided. Established experimental therapeutic protocols are described, with recommendations on follow-up and monitoring. The authors are acknowledged experts, and the book will be a valuable desk reference for all who deal with inherited metabolic diseases.

Point-of-care testing (POCT) refers to pathology testing performed in a clinical setting at the time of patient consultation, generating a rapid test result that enables informed and timely clinical action to be taken on patient care. It offers patients greater convenience and access to health services and helps to improve clinical outcomes. POCT also provides innovative solutions for the detection and management of chronic, acute and infectious diseases, in settings including family practices, Indigenous medical services, community health facilities, rural and remote areas and in developing countries, where health-care services are often geographically isolated from the nearest pathology laboratory. *A Practical Guide to Global Point-of-Care Testing* shows health professionals how to set up and manage POCT services under a quality-assured, sustainable, clinically and culturally effective framework, as well as understand the wide global scope and clinical applications of POCT. The book is divided into three major themes: the management of POCT services, a global perspective on the clinical use of POCT, and POCT for specific clinical settings. Chapters within each theme are written by experts and explore wide-ranging topics such as selecting and evaluating devices, POCT for diabetes, coagulation disorders, HIV, malaria and Ebola, and the use of POCT for disaster management and in extreme environments. Figures are included throughout to illustrate the concepts, principles and practice of POCT. Written for a broad range of practicing health professionals from the fields of medical science, health science, nursing, medicine, paramedic science, Indigenous health, public health, pharmacy, aged care and sports medicine, *A Practical Guide to Global Point-of-Care Testing* will also benefit university students studying these health-related disciplines. Covers all of the major medical disciplines, describing the classic presentation of important diseases and the

management of patients with the particular disease. 350 clinical vignettes mimic Step 2 test conditions.

White blood cell (WBC) counts and their subgroups of cell types such as neutrophils, lymphocytes, monocytes, eosinophils and basophils (often called "differentials"), are common clinical measurement to diagnose and monitor a variety of pathologic conditions such as bacterial or viral infections, inflammation, leukemia, immunodeficiency states, and post-chemotherapy, or as part of a complete blood cell count in a routine health checkup. WBC counts and differentials are currently performed in central laboratories using blood analyzers with blood collected by venipuncture. Point of care (POC) analyses of complete blood cell counts are being developed with the aim to reduce turnaround time and increase the chance that more timely medical decisions can be made in remote sites, or in outpatient settings. Currently, four POC WBC systems are being used: Chempaq XBC (Chempaq A/S, Denmark), HemoCue WBC (HemoCue AB, Angelholm, Sweden), poch -100i (Sysmex Corporation, Kobe, Japan), and ABX-MicrosCRP200 (Horiba Medical, Montpellier, France). The HemoCue, poch-100i and ABX-MicrosCRP200 systems are available for use in Canada. This Rapid Response review aims to compare the clinical effectiveness, accuracy, precision, and cost-effectiveness of POC testing technologies to assess WBC counts and differentials compared to central laboratory methods. Guidelines associated with the use of POC testing to assess WBC count and differentials will also be examined.
