Client-Side Reporting with Visual Studio in C#Apress
This book has all the code in it needed to create RDLC Reports dynamically. There is a lot of information on how this code came about and with some cooperation from the reader, can be added to a project so that in less than a day, you will be able to create table style RDLC Reports that require none of the usual manual adjustments to the field widths - which I personally, found taking more time to do than creating the report itself.Included in this book is code to create RDLC Reports from event logs and from the registry.Imagine being able to perusal through the registry, find a subkey with valuable Names. types and data, right click on the DataGridView and press the button and one second later, your report is created and being displayed right in front of you with perfect widths between fields.That's kind of addicting. ODOT utilizes Automated Traffic Recorder (ATR) devices to collect highway traffic vehicle count and class data. The data is used to support funding proposals and highway maintenance decisions. The Federal Highway Administration (FHWA) requires each state to test their highway traffic data collection equipment (Ref: 23 CFR Parts 500.203 & 500.204). Further, the regulation states that only equipment passing the test procedures may be used for the collection of data for projects funded by FHWA. The objective of this research project is to design a bench top tester for testing ATRs that are equipped to count/classify 8 lanes of traffic with a loop-piezo-loop sensor arrangement. The new tester will be designated as model ATRT-1716 and will be similar in operation to the ATRT-1700 model which ODOT has used successfully for many years.

Formerly known as DB2® Warehouse, InfoSphereTM Warehouse enables a unified, powerful data warehousing environment. It provides access to structured and unstructured data, as well as operational and transactional data. In this IBM® Redbooks® publication, we provide a brief overview of InfoSphere Warehouse, but the primary objective is to discuss and describe the capabilities of one particular component of the InfoSphere Warehouse, which is InfoSphere Warehouse Cubing Services. InfoSphere Warehouse Cubing Services is designed to provide a multidimensional view of data stored in relational databases, for significantly improved query and analysis capabilities. For this, there are particular schema designs that are typically used for these data warehouse and data mart databases, called dimensional, or cube, models. Optimization techniques are used to dramatically improve the performance of the OLAP queries, which are a core component of data warehousing and analytics. InfoSphere Warehouse Cubing Services works with business intelligence (BI) tools, and clients, such as Cognos® , Alphablox, and Microsoft® Excel® , through client interfaces, to accelerate OLAP queries from many data sources. We describe these interfaces and provide examples of how to use them to improve the performance of your OLAP queries.
