SecurIntegration GmbH is an independent SAP security consultancy acting on an international scale from both their Cologne headquarters in Germany and their global network of branch offices in Walldorf, London, Barcelona, Singapore and Palo Alto. In 2007, SAP Service Partner SecurIntegration was awarded the title of Special Expertise Partner for Governance, Risk and Compliance (GRC). The company is specialized in the fields of SAP NetWeaver authorizations, SAP security audits, the design of secure enterprise portals and Single Sign-On. Company services focus on SAP security issues, covering consultancy, training and solution finding. The team of SecurIntegration authors have merged their SAP NetWeaver Portal design, development and operation experience into this book. SAP NetWeaver Portal for your security Securing corporate information and business processes is a major challenge companies will face in the future. This book strives to provide businesses with valuable hands-on help on how to plan and implement a secure SAP NetWeaver Portal. The team of authors ushers their readers along from the basics and prerequisites of a business portal, moving on to the topics of - Portal infrastructure - Monitoring & logging - User management - Authentication - Single Sign-On - Roles and authorizations - Knowledge management and, last but not least, to five solution case studies presenting real-life scenarios of how a secure SAP NetWeaver Portal can be implemented.

Dozens of books have been written about the ERP security, but they mainly focus on the technical aspects, on where to click on the screen, and on the actions to perform in the system. What about the design? What is the methodology to adopt in order to gather the needs from the customer? How does one interact with other teams? What does one begin with in order to build the ERP security? What is the strategy for effective security testing? All of these questions were unaddressed and it was a HEADACHE! Therefore, I believed it was urgent to write a book that shows what I had found out through my own long days of research and months of integration projects. In this guide, all issues are taken from the practical and methodological views for information systems in general. The examples are based on SAP ERP. Templates and examples are provided in order to help you in the information gathering, the workshops, the design, the building and the testing of the security. Some of the templates can also be

SAP is a market leader in enterprise business application software. SAP solutions provide a rich set of composable application modules, and configurable functional capabilities that are expected from a comprehensive enterprise business application software suite. In most cases, companies that adopt SAP software remain heterogeneous enterprises running both SAP and non-SAP systems to support their business processes. Regardless of the specific scenario, in heterogeneous enterprises most SAP implementations must be integrated with a variety of non-SAP enterprise systems: Portals Messaging infrastructure Business process management (BPM) tools Enterprise Content Management (ECM) methods and tools Business analytics (BA) and business intelligence (BI) technologies Security Systems of record Systems of engagement The tooling included with SAP software addresses many needs for creating SAP-centric environments. However, the classic approach to implementing SAP functionality generally leaves the business with a rigid solution that is difficult and expensive to change and enhance. When SAP software is used in a large, heterogeneous enterprise environment, SAP clients face the dilemma of selecting the correct set of tools and platforms to implement SAP functionality, and to integrate the SAP solutions with non-SAP systems. This IBM® Redbooks® publication explains the value of integrating IBM software with SAP solutions. It describes how to enhance and extend

pre-built capabilities in SAP software with best-in-class IBM enterprise software, enabling clients to maximize return on investment (ROI) in their SAP investment and achieve a balanced enterprise architecture approach. This book describes IBM Reference Architecture for SAP, a prescriptive blueprint for using IBM software in SAP solutions. The reference architecture is focused on defining the use of IBM software with SAP, and is not intended to address the internal aspects of SAP components. The chapters of this book provide a specific reference architecture for many of the architectural domains that are each important for a large enterprise to establish common strategy, efficiency, and balance. The majority of the most important architectural domain topics, such as integration, process optimization, master data management, mobile access, Enterprise Content Management, business intelligence, DevOps, security, systems monitoring, and so on, are covered in the book. However, there are several other architectural domains which are not included in the book. This is not to imply that these other architectural domains are not important or are less important, or that IBM does not offer a solution to address them. It is only reflective of time constraints, available resources, and the complexity of assembling a book on an extremely broad topic. Although more content could have been added, the authors feel confident that the scope of architectural material that has been included should provide organizations with a fantastic head start in defining their own enterprise reference architecture for many of the important architectural domains, and it is hoped that this book provides great value to those reading it. This IBM Redbooks publication is targeted to the following audiences: Client decision makers and solution architects leading enterprise transformation projects and wanting to gain further insight so that they can benefit from the integration of IBM software in large-scale SAP projects. IT architects and consultants integrating IBM technology with SAP solutions.

Over the last few years, financial statement scandals, cases of fraud and corruption, data protection violations, and other legal violations have led to numerous liability cases, damages claims, and losses of reputation. As a reaction to these developments, several regulations have been issued: Corporate Governance, the Sarbanes-Oxley Act, IFRS, Basel II and III, Solvency II and BilMoG, to name just a few. In this book, compliance is understood as the process, mapped not only in an internal control system, that is intended to guarantee conformity with legal requirements but also with internal policies and enterprise objectives (in particular, efficiency and profitability). The current literature primarily confines itself to mapping controls in SAP ERP and auditing SAP systems. Maxim Chuprunov not only addresses this subject but extends the aim of internal controls from legal compliance to include efficiency and profitability and then well beyond, because a basic understanding of the processes involved in IT-supported compliance management processes are not delivered along with the software. Starting with the requirements for compliance (Part I), he not only answers compliance-relevant questions in the form of an audit guide for an SAP ERP system and in the form of risks and control descriptions (Part II), but also shows how to automate the compliance management process based on SAP GRC (Part III). He thus addresses the current need for solutions for implementing an integrated GRC system in an organization, especially focusing on the continuous control monitoring topics. Maxim Chuprunov mainly targets compliance experts, auditors, SAP project managers and consultants responsible for GRC products as readers for his book. They will find indispensable information for their daily work from the first to the last page. In addition, MBA, management information system students as well as senior managers like CIOs and CFOs will find a wealth of valuable information on compliance in the SAP ERP environment, on GRC in general and its implementation in particular.
