In a vicious cycle, poor nutritional health leads to acute and chronic disease, and disease states are catastrophic to nutritional health. The magnitude of nutritional depletion from any cause depends to a large extent on the nutritional reserves an individual has accumulated over time. In our increasingly older population,

nutritional reserves are

There is unequivocal experimental, epidemiological, and clinical evidence demonstrating a correlation between diet and increased risk of cardiovascular disease (CVD). While nutritionally-poor diets can have a significant negative impact on cardiovascular health, dietary interventions with specific nutrients and/or functional foods are considered cost-effective and efficient components of prevention strategies. It has been estimated that nutritional factors may be responsible for approximately 40% of all CVD. Indeed, in one of the seminal studies conducted on modifiable risk factors and heart health (the INTERHEART study), >90% of all myocardial infarctions were attributed to preventable environmental factors with nutrition identified as one of the important determinants of CVD. There is an increasing public interest in and scientific investigation into establishing dietary approaches that can be undertaken for the prevention and treatment of CVD. This Special Issue provides an insight into the influential role of nutrition and dietary habits on cardiovascular health and disease, as well as their mechanisms of therapeutic and preventive action. This open access book discusses the current role of smallholders in connection with food security and poverty reduction in developing countries. It addresses the opportunities they enjoy, and the constraints they face, by analysing the availability, access to and utilization of production factors. Due to the relevance of smallholder farms, enhancing their production capacities and economic and social resilience could produce positive impacts on food security and nutrition at a number of levels. In addition to the role of small farmers as food suppliers, the book considers their role as consumers and their level of nutrition security. It investigates the link between agriculture and nutrition in order to better understand how agriculture affects human health and dietary patterns. Given the importance of smallholdings, strategies to increase their productivity are essential to improving food and nutrition security, as well as food diversity.

Food and nutrition insecurity is a consequence and a driver of civil conflict. War and civil unrest reduce household incomes and employment opportunities through economic recession; cause losses in people's purchasing power from price inflation; and restrict food availability, access, and utilization through disruption of infrastructure. In turn, low per capita income and poverty, youth unemployment, and social and economic inequality—often combined with poor governance, population pressure, and rough terrain—are factors driving civil conflict. Recently, food and nutrition insecurity has been identified as another main driver of civil conflict globally and even more so in Arab countries. Specifically, rising international food prices were reported to have significantly increased the incidence of antigovernment demonstrations, riots, and civil conflict in low-income countries in the past.
