Addresses the Aging Process and Its Effect on Sports Performance Age-related changes influence all physiological systems, including those used during exercise and sport. Highlighting masters athletes—older adults who train and compete in organized sports—Nutrition and Performance in Masters Athletes examines the extent to which regular physical training can impact these changes. This book bridges the gap between theory and practice, addressing nutritional, exercise and sport sciences, and the actual performance of masters athletes and older exercisers. It reviews in detail many age-related changes that occur in the physiological systems, provides implications of these changes for masters athletes, coaches and clinicians, explores scientifically-based methods to maximize sprint, strength and power, team sport players, endurance and ultra-endurance performance, and focuses on the unique nutritional needs of master athletes. Examines the Growing Body of Knowledge on Masters Athletes Each chapter has been written by a world-leading authority in their field. Contributors focus on a specific topic and discuss available research. Incorporating information from studies on younger and older athletes and healthy older non-

athletes, they help determine the training and nutrition implications for sports medicine professionals and clinicians, masters athletes and coaches, and future research directions for academic and postgraduate students. The book includes material on endurance, ultra-endurance, speed, strength and power, and team sports athletes. Food and nutrition insecurity is a consequence and a driver of civil conflict. War and civil unrest reduce household incomes and employment opportunities through economic recession; cause losses in people's purchasing power from price inflation; and restrict food availability, access, and utilization through disruption of infrastructure. In turn, low per capita income and poverty, youth unemployment, and social and economic inequality—often combined with poor governance, population pressure, and rough terrain—are factors driving civil

conflict. Recently, food and nutrition insecurity has been identified as another main driver of civil conflict globally and even more so in Arab countries. Specifically, rising international food prices were reported to have significantly increased the incidence of antigovernment demonstrations, riots, and civil conflict in low-income countries in the past.
