This eagerly awaited second edition of Heinz Heisler's Advanced Vehicle Technology is a comprehensive and thorough description of vehice bodies and components. The second edition has been rigorously updated to provide additional material on subjects such as antilock braking, vehicle aerodynamics, tire tread design advances, electronically controlled anti-vibration engine mountings and transport refrigeration. Around 100 new diagrams have been included to complement the text. Advanced Vehicle Technology 2nd edition's depth of coverage, detailed illustrations and fluent and precise style are the outstanding features in this high quality student text. More quality artwork has been added to enhance and add value to the explanation given in the text 16 key topics have been updated to bring this 2nd edition in line with current technology Fully international in scope, reflecting the nature of contemporary vehicle engineering From tracking spring peepers and raising tadpoles to learning about seeds and recording plant growth, Explore Spring! 25 Great Ways to Learn About Spring invites young readers to explore the wonders of spring by becoming scientists in the field. Combining hands-on learning with solid science, trivia, riddles, and terrific illustrations, projects investigate "the reason for the season" and include identifying trees and measuring their growth, recording soil temperature, and observing the forest floor. Bird migration and nest building are covered, and the movement of air and water is studied with experiments in capillary action and in such activities as "Making Parachutes," Making Kites," and "Mapping Air Currents with Bubbles."

During the last decades, the growth of micro-electronics has reduced the cost of computing power to a level acceptable to industry and has made possible sophisticated control strategies suitable for many applications. Vibration c- trol is applied to all kinds of engineering systems to obtain the desired dynamic behavior, improved accuracy and increased reliability during operation. In this context, one can think of applications related to the control of structures' vib- tion isolation, control of vehicle dynamics, noise control, control of machines and mechanisms and control of ?uid-structure-interaction. One could continue with this list for a long time. Research in the ?eld of vibration control is extremely comprehensive. Pr- lems that are typical for vibration control of nonlinear mechanisms and str- tures arise in the ?elds of modeling systems in such a way that the model is suitable for control design, to choose appropriate actuator and sensor locations and to select the actuators and sensors. The objective of the Symposium was to present and discuss methodsthat contribute to the solution of such problems and to demonstrate the state of the art in the ?eld shown by typical examples. The intention was to evaluate the limits of performance that can beachieved by controlling the dynamics, and to point out gaps in present research and give links for areas offuture research. Mainly, it brought together leading experts from quite different areas presenting theirpoints of view.
