'The story of oncology is not only fascinating but also contains many accounts of dead ends, chance discoveries, illusions, mistakes and disappointments alongside the few successes.' These words are taken from the introduction to this book. The author, professor emeritus of Medical Oncology, reviews all aspects of the problem of cancer from a historical perspective, from the oldest existing records to the latest scientific and medical advances. It will interest the many people engaged in the treatment of cancer to read how the current therapeutic methods came about, and the book may also provide inspiration for cancer researchers, and for all those directly or indirectly involved with cancer. The layman looking for background information on a particular treatment may find it useful too. The various chapters can be read independently. A glossary and a few explanatory diagrams augment the text. This book grew out of an invitation the author received to lecture on the history of oncology. During his background reading, he discovered that there was no single volume dealing with the entire history of the subject. Fortunately, however, a great deal of information could be found here and there in the literature. As he read, he was struck by the fascinating stories behind many discoveries, and felt impelled to put them together in a single comprehensive account. The results of his labors are presented in this remarkable volume. The author, Prof. D.J.Th. (Theo) Wagener, was head of the department of Medical Oncology at the Radboud University Nijmegen Medical Centre in the Netherlands from 1982 to 2001, chairman of the Educational Committee of the European Society of Medical Oncology (ESMO), a member of the Educational Committee of the American Society of Clinical Oncology (ASCO) and a member of various international scientific working groups, mainly of the European Organization for Research and Treatment of Cancer (EORTC).

Effective care of the cancer patient increasingly involves systemic treatment, and as the range of available therapeutic agents continues to expand, the medical oncologist must be fully aware of the combinations. This new edition provides a practical overview of the many treatment choices, and has been fully updated, including discussion of new classification systems, anticancer agents and treatment protocols.

From the 14th century to the end of the 16th century, the social and cultural life of Europe was pervaded by a profound renewal, originating in Italy, which brought the arts and humanities to reach levels unknown for more than a millennium. It was said with enthusiasm that glory would be achieved by removing the rust of the medieval period and emulating the ancients. New inventions, including the printing press, helped to change the basis of culture: books multiplied, and educators were happy to circulate them. Illustrated herbals flourished and, in the rebirth of anatomy, the images of the human body in Vesalius' Fabrica still inspire admiration for their shapes and details to this day. In the 17th century a fundamental contribution to the advancement of medicine was made by Harvey with the discovery of the circulation of blood, not to mention the contribution made to the definition of science and the experimental method by Galileo, Bacon and Descartes. Great innovators also emerged in chemistry, in microscopic anatomy, and in the definition of the physiology of the organism and diseases. This was the era when the scientific revolution in many fields of knowledge put an end to the Ptolemaic conception of the Universe and Aristotelian physics; it brought out a more realistic vision of nature and the human body; it profoundly cracked the foundations of traditional Galenic medicine and created the conditions for its complete dismantling in the 18th century. The description of these events in the fourth volume of Medicine and Oncology presents us with the extraordinary story of the beginning of modern medicine in the usual fluent style and with numerous illustrations that do not decorate but enlighten the text. Massimo Lopez was Director of the Division of Medical Oncology of the Regina Elena Institute for Cancer Research in Rome and Professor of Oncology at the 1st School of Specialisation in Oncology at Sapienza University, Rome. He has published over 200 articles in the most important scientific journals in Italy and abroad and written several books, including a monograph on breast cancer, one on GIST, and the manual of practical medical oncology that bears his name.

The continuing success of the VICC's Manual of Clinical Oncology and the continuing refinement of our educational objectives in cancer designed for graduating medical students and young practitioners, coupled with significant additional knowledge in the cancer field have all led to the decision to publish a Fourth Edition. The collaboration of the World Health Organization (WHO) and the Pan-American Health Organization (PAHO) in our international and regional conferences in cancer education and the development of courses using the Manual as a basic resource have aided further definition of the VICC's role in cancer education throughout the world. Our Revision Committee believes that we have incorporated in this small volume most of the

knowledge about cancer which is essential for all students and practitioners to know and that we have done so in a clear and concise manner. A large proportion of the material presented herein is devoted to basic aspects, yet presented so that the clinical implications are clear. Although we do not feel that general physicians need to know minor details about all cancers, we feel it is particularly important to be somewhat thorough in our discussions of the more common cancers. We have omitted discussion of the rare cancers, and limited ourselves to the major concepts and principles of the less common cancers.
