Study on the agricultural performance of West Bengal during 1957-1994.

The book entitled "The Theory of Samples Surveys and Statistical Decisions" is useful to all the P.G. and Ph.D. students and faculty members of statistics, agricultural statistics and engineering, social; science and biological sciences.

Since 1972 there has been a close contact through their publications between the Netherlands Interuniversity Demographic Institute at The Hague and the Population and Family Study Centre at Brussels. This co-operation has resulted in the joint publication of the journal *Bevolking en Gezin* (Population and Family) in the Dutch language. However, there has been a need for wider circulation of the Dutch language studies and research in the field of population and the family. In particular it was thought necessary to make possible an exchange of ideas and findings with population and family scientists abroad. The volume *Population and Family in the Low Countries* intends to facilitate this international discussion by at least partially lifting the language barrier curtain. Some of the articles and documents included were originally published in the Dutch language, others were written especially for this volume. *Population and family* covers a very wide field and so do the chapters presented. In addition to demographic studies, articles are presented on population and family sociology and social biology. The editors hope that this second volume of *Population and Family in the Low Countries* reader, the sixth in their yearly publication series, will serve its purpose. 'A textbook which emphasises clarity of exposition and simplification of the mathematical presentation of topics. Assumes only college algebra and introductory statistics, since the greatest attention is given to the economic aspects of econometrics'. Journal of Economic Literature

This book focuses on the meaning of statistical inference and estimation. Statistical inference is concerned with the problems of estimation of population parameters and testing hypotheses. Primarily aimed at undergraduate and postgraduate students of statistics, the book is also useful to professionals and researchers in statistical, medical, social and other disciplines. It discusses current methodological techniques used in statistics and related interdisciplinary areas. Every concept is supported with relevant research examples to help readers to find the most suitable application.

Statistical tools have been presented by using real-life examples, removing the "fear factor" usually associated with this complex subject. The book will help readers to discover diverse perspectives of statistical theory followed by relevant worked-out examples. Keeping in mind the needs of readers, as well as constantly changing scenarios, the material is presented in an easy-to-understand form.

This volume grew out of a National Bureau of Economic Research conference on exchange rates held in Bellagio, Italy, in 1982. In it, the world's most respected international monetary economists discuss three significant new views on the economics of exchange rates - Rudiger Dornbusch's overshooting model, Jacob Frenkel's and Michael Mussa's asset market variants, and Pentti Kouri's current account/portfolio approach. Their papers test these views with evidence from empirical studies and analyze a number of exchange rate policies in use today, including those of the European Monetary System.

European Regional Growth is the result of three major influences. First, the ongoing integration of the European regional economies and the need to understand what this means for European economic and social cohesion. Second, the development of geo-economic theories. Third, the development of techniques of spatial data analysis, simulation, data visualization and spatial econometrics. The outcome is a collection of chapters that apply these methods, motivated by a variety of theoretical positions. The book provides powerful and detailed analyses of the causes of income, productivity and employment variations across Europe's regions, and insights into their future prospects. A textbook for a one-semester course for advanced undergraduate and graduate students in economics. Covers regression techniques in the context of single equation econometric models, featuring MINITAB and SHAZAM software examples for attacking real-world problems.

Political Economy of the Swiss National Bank examines whether there exists any systematic political influence on Swiss monetary policy. A partial adjustment model is used to derive the reaction functions. Models of political business cycles and the theory of legislative control are for the first time applied to the Swiss institutional setting. The inflationary performance of the National Bank is not explained with the legal relationship between the executive branch of government and the central bank. It is interpreted as the result of the structure of the executive (commission government) and the characteristics of the Swiss political market for monetary policy. In empirical tests no indirect political influence, defined as a systematic relationship between fiscal and monetary policy, and no direct political influence from elections, the executive and the legislature can be detected.

growth in the OECD, transition economies and developing economies - the distinguished cast of contributors address some of the most important contemporary issues and developments in the field. These include, amongst others: endogenous growth theory, Keynesian theories of the business cycle and growth, unemployment and growth, FDI and productivity spillovers, and knowledge externalities and growth. This useful analysis of the many facets of economic growth will be an essential read for those interested in economic theory and economic policy-making, as well as students and scholars of macroeconomics and finance. Here in one easy-to-understand volume are the statistical procedures and techniques the agricultural researcher needs to know in order to design, implement, analyze, and interpret the results of most experiments with crops. Designed specifically for the non-statistician, this valuable guide focuses on the practical problems of the field researcher. Throughout, it emphasizes the use of statistics as a tool of research—one that will help pinpoint research problems and select remedial measures. Whenever possible, mathematical formulations and statistical jargon are avoided. Originally published by the International Rice Research Institute, this widely respected guide has been totally updated and much expanded in this Second Edition. It now features new chapters on the analysis of multi-observation data and experiments conducted over time and space. Also included is a chapter on experiments in farmers' fields, a subject of major concern in developing countries where agricultural research is commonly conducted outside

experiment stations. *Statistical Procedures for Agricultural Research, Second Edition* will prove equally useful to students and professional researchers in all agricultural and biological disciplines. A wealth of examples of actual experiments help readers to choose the statistical method best suited for their needs, and enable even the most complicated procedures to be easily understood and directly applied. *An International Rice Research Institute Book*

*Hospital Cost Analysis* provides an overview of theoretical developments in the economic analysis of production and costs in the multiproduct firm, and discusses these developments. Following a lucid explanation of the concepts of jointness, input/output separability and returns to scale, a detailed discussion of the concept measurement and classification of hospital output is provided. A fundamental dilemma confronting economists interested in estimating hospital cost functions is highlighted, viz. the trade-off between flexibility in functional form and homogeneity within hospital output categories. Empirical results on the effects of case mix, scale and utilisation, public/private ownership, and the centralised administration of hospital systems on hospital costs are presented. The implications of hospital cost analysis for public policy with respect to hospital payment schemes, including schemes based on Diagnosis Related Groups (DRGs), are also considered. This book brings together the literature on hospital cost analysis with theoretical developments in the analysis of the multiproduct cost functions. It will be of considerable interest to teachers and students of health economics and health policy advisers interested in the determinants of hospital costs and the design of hospital payment schemes.

Literature hailed it as a "textbook which emphasizes clarity of exposition and simplification of the mathematical presentation of topics. The author's extensive revisions of several chapters and sections are aimed at further clarification of important and relevant data.

In recent years, spatial analysis has become an increasingly active field, as evidenced by the establishment of educational and research programs at many universities. Its popularity is due mainly to new technologies and the development of spatial data infrastructures. This book illustrates some recent developments in spatial analysis, behavioural modelling, and computational intelligence. World renown spatial analysts explain and demonstrate their new and insightful models and methods. The applications are in areas of societal interest such as the spread of infectious diseases, migration behaviour, and retail and agricultural location strategies. In addition, there is emphasis on the uses of new technologies for the analysis of spatial data through the application of neural network concepts.

Imad Moosa challenges convention with this comprehensive and compelling critique of econometrics, condemning the common practices of misapplied statistical methods in both economics and finance.
